DataGridContentFilter Class
C1.WPF.DataGrid.Filters Namespace

DataGridContentFilter Constructor

Initializes a new instance of a DataGridContentFilter.

Syntax

Visual Basic (Declaration)	
`Public Function New()`	
C#	
`public DataGridContentFilter()`	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

DataGridContentFilter Class
C1.WPF.DataGrid.Filters Namespace

FilterChanged Event

Syntax

Visual Basic (Declaration)	
`Public Event FilterChanged As System.EventHandler(Of PropertyChangedEventArgs(Of DataGridFilterState))`	
C#	
`public event`	

```
System.EventHandler<PropertyChangedEventArgs<DataGridFilterState>>
FilterChanged
```

Event Data

The event handler receives an argument of type C1.WPF.PropertyChangedEventArgs<T> containing data related to this event. The following **PropertyChangedEventArgs<T>** properties provide information specific to this event.

Property	Description
NewValue	
OldValue	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

OnApplyTemplate Method

Builds the visual tree for the DataGridFilterItem control when a new template is applied.

Syntax

Visual Basic (Declaration)
`Public Overrides Sub OnApplyTemplate()`
C#
`public override void OnApplyTemplate()`

Remarks

This method is invoked whenever application code or an internal process, such as a rebuilding layout pass, calls the **ApplyTemplate** method.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IsCurrent Property

Gets or sets a value indicating when this item is the current one.

Syntax

Visual Basic (Declaration)

```
Public Property IsCurrent As System.Boolean
```

C#

```
public System.bool IsCurrent {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

SelectedBackground Property

Gets or sets the **System.Windows.Media.Brush** used to highlight the control when it is selected.

Syntax

Visual Basic (Declaration)
`Public Property SelectedBackground As System.Windows.Media.Brush`
C#
`public System.Windows.Media.Brush SelectedBackground {get; set;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

C1.WPF.DataGrid.Filters Namespace

DataGridFilterList Constructor

Initializes a new instance of a DataGridFilterList.

Syntax

Visual Basic (Declaration)
`Public Function New()`
C#
`public DataGridFilterList()`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

PropertyChanged Event

Occurs when a property value changes.

Syntax

Visual Basic (Declaration)
`Public Event PropertyChanged As System.ComponentModel.PropertyChangedEventHandler`
C#
`public event System.ComponentModel.PropertyChangedEventHandler PropertyChanged`

Event Data

The event handler receives an argument of type System.ComponentModel.PropertyChangedEventArgs containing data related to this event. The following **PropertyChangedEventArgs** properties provide information specific to this event.

Property	Description
PropertyName	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Reference

DataGridFilterListPanel Members
C1.WPF.DataGrid.Filters Namespace

Overview

Custom panel used to display a list of filters.

Object Model

Syntax

Visual Basic (Declaration)
`Public Class DataGridFilterListPanel` `   Inherits System.Windows.Controls.Panel`
C#
`public class DataGridFilterListPanel : System.Windows.Controls.Panel`

Inheritance Hierarchy

System.Object
  System.Windows.Threading.DispatcherObject
    System.Windows.DependencyObject
      System.Windows.Media.Visual
        System.Windows.UIElement
          System.Windows.FrameworkElement
            System.Windows.Controls.Panel
              C1.WPF.DataGrid.Filters.DataGridFilterListPanel

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Public Fields

	Name	Description
	CellPaddingProperty	Identifies the CellPadding dependency property.
	DelayProperty	Identifies the Delay dependency property.
	FilterOperationProperty	When attached to a C1.WPF.DataGrid.DataGridColumn changes the filter operation that will be performed when filtering using a DataGridFilterRow.

Top

Public Properties

	Name	Description
	ActualCanUserToggleDetails	Gets or sets a value indicating whether the user can toggle

		details, taking in consideration properties of the containing DataGrid. (Inherited from C1.WPF.DataGrid.DataGridRow)
	ActualDetailsVisibility	Gets a value indicating whether this row is showing details, taking in consideration properties of the containing DataGrid. (Inherited from C1.WPF.DataGrid.DataGridRow)
	ActualHeight	Gets the actual height in pixels. (Inherited from C1.WPF.DataGrid.DataGridRow)
	ActualHeightWithoutDetails	Gets the actual height in pixels (without the details). (Inherited from C1.WPF.DataGrid.DataGridRow)
	CanUserResize	Gets or sets a value indicating whether this row can be resized by the user. (Inherited from C1.WPF.DataGrid.DataGridRow)
	CanUserToggleDetails	Gets or sets a value indicating whether the user can toggle details. (Inherited from C1.WPF.DataGrid.DataGridRow)
	CellPadding	Gets or sets the cell padding.
	CellStyle	Gets or sets the style applied to all the cells of this row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	DataGrid	Gets the data grid to which the row belongs. (Inherited from C1.WPF.DataGrid.DataGridRow)
	DataItem	Gets the data of the row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Delay	Gets or sets the delay time used to filter after the last typed character.
	DependencyObjectType	(Inherited from System.Windows.DependencyObject)
	DetailsPresenter	Gets the visual element that will be arranged at the bottom

		of the row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	DetailsVisibility	Gets or sets a value indicating whether this row is showing details. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Dispatcher	(Inherited from System.Windows.Threading.DispatcherObject)
	Errors	Gets the collection of errors associated with this row. Add errors here if you want to display an error message in the corresponding row header. (Inherited from C1.WPF.DataGrid.DataGridRow)
	HeaderPresenter	Gets the visual element that represent the header of this row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Height	Gets or sets the height of this row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	IndentWidth	Gets the distance between the row header and the first cell of the row. This empty space is only present when there are groups in the data grid. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Index	Gets the index of the row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	IsEditable	Gets a value indicating whether this row is editable. (Inherited from C1.WPF.DataGrid.DataGridRow)
	IsEditing	Gets or sets a value indicating whether this row is editing. (Inherited from C1.WPF.DataGrid.DataGridRow)
	IsMouseOver	Gets a value indicating whether the mouse is over the row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	IsSealed	(Inherited from System.Windows.DependencyObject)

	IsSelectable	Gets or sets a value indicating whether the user is allowed to set the current cell from this row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	IsSelected	Gets a value indicating whether this row is selected. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Level	Gets the grouping level of this row. This info will be used to indent the row if the grid data is grouped. (Inherited from C1.WPF.DataGrid.DataGridRow)
	MaxHeight	Gets or sets the maximum height (in pixels) allowed. (Inherited from C1.WPF.DataGrid.DataGridRow)
	MinHeight	Gets or sets the minimum height (in pixels) allowed. (Inherited from C1.WPF.DataGrid.DataGridRow)
	ParentCollection	Gets the collection of rows to which this row belongs. (Inherited from C1.WPF.DataGrid.DataGridRow)
	ParentGroup	Gets the parent group. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Presenter	Gets the visual element that represent this row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	RowHeaderStyle	Gets or sets the style applied to the row header presenter of this row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	RowStyle	Gets or sets the style of the row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	ShowVerticalFreezingSeparator	Gets a value indicating whether to show vertical freezing separator. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Type	Gets the type of row. (Inherited from C1.WPF.DataGrid.DataGridRow)

	ValidationResults	Gets the collection of errors associated with this row. Add errors here if you want to display an error message in the corresponding row header. (Inherited from C1.WPF.DataGrid.DataGridRow)
	VerticalOffset	Gets the vertical offset in pixels. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Visibility	Gets or sets the visibility of the row. (Inherited from C1.WPF.DataGrid.DataGridRow)

Top

Public Methods

	Name	Description
	ClearValue	Overloaded. (Inherited from System.Windows.DependencyObject)
	CoerceValue	(Inherited from System.Windows.DependencyObject)
	Equals	(Inherited from System.Windows.DependencyObject)
	GetCellPresenter	(Inherited from C1.WPF.DataGrid.DataGridRow)
S	GetFilterOperation	Gets the filter operation that will be performed when text is entered in the textbox of a DataGridFilterRow corresponding to the specified column.
	GetHashCode	(Inherited from System.Windows.DependencyObject)
	GetLocalValueEnumerator	(Inherited from System.Windows.DependencyObject)
	GetValue	(Inherited from System.Windows.DependencyObject)
	InvalidateProperty	(Inherited from System.Windows.DependencyObject)

	ReadLocalValue	(Inherited from System.Windows.DependencyObject)
	Refresh	Unload every visual element which is related to the row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	SetCurrentValue	(Inherited from System.Windows.DependencyObject)
S	SetFilterOperation	Sets the filter operation that will be performed when text is entered in the textbox of a DataGridFilterRow corresponding to the specified column.
	SetValue	Overloaded. (Inherited from System.Windows.DependencyObject)
	ToString	Returns a **System.String** that represents the current **System.Object**. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Validate	Overloaded. Validates the DataItem. Implement IDataErrorInfo or INotifyDataErrorInfo in order to implement your own validation rules. (Inherited from C1.WPF.DataGrid.DataGridRow)

Top

Public Events

	Name	Description
	CanUserResizeChanged	Occurs after the CanUserResize value changed. (Inherited from C1.WPF.DataGrid.DataGridRow)
	CanUserToggleDetailsChanged	Occurs after the CanUserToggleDetails value changed. (Inherited from C1.WPF.DataGrid.DataGridRow)
	DetailsVisibilityChanged	Occurs after the visibility of the details of the row changed. (Inherited from C1.WPF.DataGrid.DataGridRow)

	HeightChanged	Occurs after the height was changed. (Inherited from C1.WPF.DataGrid.DataGridRow)
	IsEditingChanged	Occurs when the IsEditing value changed. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Loaded	Occurs after the row is added to the collection of rows. (Inherited from C1.WPF.DataGrid.DataGridRow)
	PropertyChanged	Occurs when a property value changes. (Inherited from C1.WPF.DataGrid.DataGridRow)
	VisibilityChanged	Occurs after the visibility of the row changed. (Inherited from C1.WPF.DataGrid.DataGridRow)

GetFilterOperation Method

The column.

Gets the filter operation that will be performed when text is entered in the textbox of a DataGridFilterRow corresponding to the specified column.

Syntax

Visual Basic (Declaration)

```
Public Shared Function GetFilterOperation( _
   ByVal column As DataGridColumn _
) As DataGridFilterOperation
```

C#

```
public static DataGridFilterOperation GetFilterOperation(
   DataGridColumn column
)
```

Parameters

column

The column.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

SetFilterOperation Method

The column.

The operation.

Sets the filter operation that will be performed when text is entered in the textbox of a DataGridFilterRow corresponding to the specified column.

Syntax

Visual Basic (Declaration)

```
Public Shared Sub SetFilterOperation( _
   ByVal column As DataGridColumn, _
   ByVal value As DataGridFilterOperation _
)
```

C#

```
public static void SetFilterOperation(
   DataGridColumn column,
   DataGridFilterOperation value
)
```

Parameters

column

The column.

value

The operation.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Properties

%%scrap%%

" -->

For a list of all members of this type, see DataGridFilterRow members.

Public Properties

	Name	Description
	ActualCanUserToggleDetails	Gets or sets a value indicating whether the user can toggle details, taking in consideration properties of the containing DataGrid. (Inherited from C1.WPF.DataGrid.DataGridRow)
	ActualDetailsVisibility	Gets a value indicating whether this row is showing details, taking in consideration properties of the containing DataGrid. (Inherited from C1.WPF.DataGrid.DataGridRow)
	ActualHeight	Gets the actual height in pixels. (Inherited from C1.WPF.DataGrid.DataGridRow)
	ActualHeightWithoutDetails	Gets the actual height in pixels (without the details).

		(Inherited from C1.WPF.DataGrid.DataGridRow)
	CanUserResize	Gets or sets a value indicating whether this row can be resized by the user. (Inherited from C1.WPF.DataGrid.DataGridRow)
	CanUserToggleDetails	Gets or sets a value indicating whether the user can toggle details. (Inherited from C1.WPF.DataGrid.DataGridRow)
	CellPadding	Gets or sets the cell padding.
	CellStyle	Gets or sets the style applied to all the cells of this row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	DataGrid	Gets the data grid to which the row belongs. (Inherited from C1.WPF.DataGrid.DataGridRow)
	DataItem	Gets the data of the row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Delay	Gets or sets the delay time used to filter after the last typed character.
	DependencyObjectType	(Inherited from System.Windows.DependencyObject)
	DetailsPresenter	Gets the visual element that will be arranged at the bottom of the row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	DetailsVisibility	Gets or sets a value indicating whether this row is showing details. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Dispatcher	(Inherited from System.Windows.Threading.DispatcherObject)
	Errors	Gets the collection of errors associated with this row. Add errors here if you want to display an error message in the corresponding row header. (Inherited from

		C1.WPF.DataGrid.DataGridRow)
	HeaderPresenter	Gets the visual element that represent the header of this row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Height	Gets or sets the height of this row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	IndentWidth	Gets the distance between the row header and the first cell of the row. This empty space is only present when there are groups in the data grid. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Index	Gets the index of the row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	IsEditable	Gets a value indicating whether this row is editable. (Inherited from C1.WPF.DataGrid.DataGridRow)
	IsEditing	Gets or sets a value indicating whether this row is editing. (Inherited from C1.WPF.DataGrid.DataGridRow)
	IsMouseOver	Gets a value indicating whether the mouse is over the row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	IsSealed	(Inherited from System.Windows.DependencyObject)
	IsSelectable	Gets or sets a value indicating whether the user is allowed to set the current cell from this row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	IsSelected	Gets a value indicating whether this row is selected. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Level	Gets the grouping level of this row. This info will be used to indent the row if the grid data is grouped. (Inherited from C1.WPF.DataGrid.DataGridRow)

	MaxHeight	Gets or sets the maximum height (in pixels) allowed. (Inherited from C1.WPF.DataGrid.DataGridRow)
	MinHeight	Gets or sets the minimum height (in pixels) allowed. (Inherited from C1.WPF.DataGrid.DataGridRow)
	ParentCollection	Gets the collection of rows to which this row belongs. (Inherited from C1.WPF.DataGrid.DataGridRow)
	ParentGroup	Gets the parent group. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Presenter	Gets the visual element that represent this row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	RowHeaderStyle	Gets or sets the style applied to the row header presenter of this row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	RowStyle	Gets or sets the style of the row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	ShowVerticalFreezingSeparator	Gets a value indicating whether to show vertical freezing separator. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Type	Gets the type of row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	ValidationResults	Gets the collection of errors associated with this row. Add errors here if you want to display an error message in the corresponding row header. (Inherited from C1.WPF.DataGrid.DataGridRow)
	VerticalOffset	Gets the vertical offset in pixels. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Visibility	Gets or sets the visibility of the row. (Inherited from C1.WPF.DataGrid.DataGridRow)

CellPadding Property

Gets or sets the cell padding.

Syntax

Visual Basic (Declaration)

```
Public Property CellPadding As System.Windows.Thickness
```

C#

```
public System.Windows.Thickness CellPadding {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Delay Property

Gets or sets the delay time used to filter after the last typed character.

Syntax

Visual Basic (Declaration)

```
Public Property Delay As System.Nullable(Of TimeSpan)
```

C#

```
public System.Nullable<TimeSpan> Delay {get; set;}
```

Remarks

Setting this property to `null` will cause the filter will not be executed while the user types.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

	HasContent	(Inherited from System.Windows.Controls.ContentControl)
	Height	(Inherited from System.Windows.FrameworkElement)
	HorizontalAlignment	(Inherited from System.Windows.FrameworkElement)
	HorizontalContentAlignment	(Inherited from System.Windows.Controls.Control)
	InputBindings	(Inherited from System.Windows.UIElement)
	InputScope	(Inherited from System.Windows.FrameworkElement)
	IsArrangeValid	(Inherited from System.Windows.UIElement)
	IsEditing	Gets or sets a value indicating whether the row is currently being edited. (Inherited from C1.WPF.DataGrid.DataGridRowHeaderPresenter)
	IsEnabled	(Inherited from System.Windows.UIElement)
	IsFocused	(Inherited from System.Windows.UIElement)
	IsHitTestVisible	(Inherited from System.Windows.UIElement)

	IsInitialized	(Inherited from System.Windows.FrameworkElement)
	IsInputMethodEnabled	(Inherited from System.Windows.UIElement)
	IsKeyboardFocused	(Inherited from System.Windows.UIElement)
	IsKeyboardFocusWithin	(Inherited from System.Windows.UIElement)
	IsLoaded	(Inherited from System.Windows.FrameworkElement)
	IsManipulationEnabled	(Inherited from System.Windows.UIElement)
	IsMeasureValid	(Inherited from System.Windows.UIElement)
	IsMerging	Gets or sets a value indicating whether the header may get merged. (Inherited from C1.WPF.DataGrid.DataGridRowHeaderPresenter)
	IsMouseCaptured	(Inherited from System.Windows.UIElement)
	IsMouseCaptureWithin	(Inherited from System.Windows.UIElement)
	IsMouseDirectlyOver	(Inherited from System.Windows.UIElement)
	IsMouseOver	(Inherited from System.Windows.UIElement)
	IsSealed	(Inherited from System.Windows.DependencyObject)
	IsSelected	Gets or sets a value indicating whether the row is currently selected or not. (Inherited from C1.WPF.DataGrid.DataGridRowHeaderPresenter)
	IsStylusCaptured	(Inherited from System.Windows.UIElement)
	IsStylusCaptureWithin	(Inherited from System.Windows.UIElement)
	IsStylusDirectlyOver	(Inherited from System.Windows.UIElement)

	IsStylusOver	(Inherited from System.Windows.UIElement)
	IsTabStop	(Inherited from System.Windows.Controls.Control)
	IsVisible	(Inherited from System.Windows.UIElement)
	Language	(Inherited from System.Windows.FrameworkElement)
	LayoutTransform	(Inherited from System.Windows.FrameworkElement)
	Margin	(Inherited from System.Windows.FrameworkElement)
	MaxHeight	(Inherited from System.Windows.FrameworkElement)
	MaxWidth	(Inherited from System.Windows.FrameworkElement)
	MinHeight	(Inherited from System.Windows.FrameworkElement)
	MinWidth	(Inherited from System.Windows.FrameworkElement)
	MouseOverBrush	Gets or sets the **System.Windows.Media.Brush** used to highlight the control when it has the mouse over. (Inherited from C1.WPF.DataGrid.DataGridRowHeaderPresenter)
	Name	(Inherited from System.Windows.FrameworkElement)
	Opacity	(Inherited from System.Windows.UIElement)
	OpacityMask	(Inherited from System.Windows.UIElement)
	OverridesDefaultStyle	(Inherited from System.Windows.FrameworkElement)
	Padding	(Inherited from System.Windows.Controls.Control)
	Parent	(Inherited from System.Windows.FrameworkElement)
	PersistId	(Inherited from System.Windows.UIElement)

	PressedBrush	Gets or sets the **System.Windows.Media.Brush** used to paint a button when it is pressed. (Inherited from C1.WPF.DataGrid.DataGridRowHeaderPresenter)
	RenderSize	(Inherited from System.Windows.UIElement)
	RenderTransform	(Inherited from System.Windows.UIElement)
	RenderTransformOrigin	(Inherited from System.Windows.UIElement)
	Resources	(Inherited from System.Windows.FrameworkElement)
	Row	Gets the owner row. (Inherited from C1.WPF.DataGrid.DataGridRowHeaderPresenter)
	SelectedBackground	Gets or sets the **System.Windows.Media.Brush** used to highlight the control when it is selected. (Inherited from C1.WPF.DataGrid.DataGridRowHeaderPresenter)
	SnapsToDevicePixels	(Inherited from System.Windows.UIElement)
	Style	(Inherited from System.Windows.FrameworkElement)
	TabIndex	(Inherited from System.Windows.Controls.Control)
	Tag	(Inherited from System.Windows.FrameworkElement)
	Template	(Inherited from System.Windows.Controls.Control)
	TemplatedParent	(Inherited from System.Windows.FrameworkElement)
	ToolTip	(Inherited from System.Windows.FrameworkElement)
	TouchesCaptured	(Inherited from System.Windows.UIElement)
	TouchesCapturedWithin	(Inherited from System.Windows.UIElement)
	TouchesDirectlyOver	(Inherited from System.Windows.UIElement)

	TouchesOver	(Inherited from System.Windows.UIElement)
	Triggers	(Inherited from System.Windows.FrameworkElement)
	Uid	(Inherited from System.Windows.UIElement)
	UseLayoutRounding	(Inherited from System.Windows.FrameworkElement)
	ValidationBackground	Gets or sets the brush used to paint the background of the validation elements. (Inherited from C1.WPF.DataGrid.DataGridRowHeaderPresenter)
	ValidationForeground	Gets or sets the brush used to paint the foreground of the validation elements. (Inherited from C1.WPF.DataGrid.DataGridRowHeaderPresenter)
	ValidationResults	Gets or sets a collection of ValidationResult related to the corresponding row. This errors will be displayed as red icon whit a tooltip showing the text of the error. (Inherited from C1.WPF.DataGrid.DataGridRowHeaderPresenter)
	ValidationState	Gets or sets the ValidationState of the related row. (Inherited from C1.WPF.DataGrid.DataGridRowHeaderPresenter)
	VerticalAlignment	(Inherited from System.Windows.FrameworkElement)
	VerticalContentAlignment	(Inherited from System.Windows.Controls.Control)
	Visibility	(Inherited from System.Windows.UIElement)
	Width	(Inherited from System.Windows.FrameworkElement)

AndText Property

Gets the localized "and" text.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property AndText As System.String
```

C#

```
public System.string AndText {get;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IsAnd Property

Gets or sets a value indicating whether "and" is selected.

Syntax

Visual Basic (Declaration)
`Public Property IsAnd As System.Boolean`
C#
`public System.bool IsAnd {get; set;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IsNone Property

Gets or sets a value indicating whether "none" is selected.

Syntax

Visual Basic (Declaration)
`Public Property IsNone As System.Boolean`
C#
`public System.bool IsNone {get; set;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IsNoneEnabled Property

Gets or sets a value indicating whether the option "none" is enabled.

Syntax

Visual Basic (Declaration)
`Public Property IsNoneEnabled As System.Boolean`
C#
`public System.bool IsNoneEnabled {get; set;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IsOr Property

Gets or sets a value indicating whether "or" is selected.

Syntax

Visual Basic (Declaration)
`Public Property IsOr As System.Boolean`

C#

```
public System.bool IsOr {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

NoneText Property

Gets the localized "none" text.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property NoneText As System.String
```

C#

```
public System.string NoneText {get;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

OrText Property

Gets the localized "or" text.

Syntax

Visual Basic (Declaration)
`Public ReadOnly Property OrText As System.String`
C#
`public System.string OrText {get;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Value Property

Gets or sets the value that represent the logic combination between filters.

Syntax

Visual Basic (Declaration)
`Public Property Value As System.Nullable(Of Boolean)`
C#
`public System.Nullable<bool> Value {get; set;}`

Remarks

`null` None `true` And `false` Or

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

PropertyChanged Event

Occurs when a property value changes.

Syntax

Visual Basic (Declaration)
`Public Event PropertyChanged As System.ComponentModel.PropertyChangedEventHandler`
C#
`public event System.ComponentModel.PropertyChangedEventHandler PropertyChanged`

Event Data

The event handler receives an argument of type System.ComponentModel.PropertyChangedEventArgs containing data related to this event. The following **PropertyChangedEventArgs** properties provide information specific to this event.

Property	Description
PropertyName	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

	Focusable	(Inherited from System.Windows.UIElement)
	FocusBrush	Gets or sets the **System.Windows.Media.Brush** used to highlight the focused control. (Inherited from C1.WPF.DataGrid.Filters.DataGridMultiLineItem)
	FocusVisualStyle	(Inherited from System.Windows.FrameworkElement)
	FontFamily	(Inherited from System.Windows.Controls.Control)
	FontSize	(Inherited from System.Windows.Controls.Control)
	FontStretch	(Inherited from System.Windows.Controls.Control)
	FontStyle	(Inherited from System.Windows.Controls.Control)
	FontWeight	(Inherited from System.Windows.Controls.Control)
	ForceCursor	(Inherited from System.Windows.FrameworkElement)

	Foreground	(Inherited from System.Windows.Controls.Control)
	Format	Gets or sets the format used to display formatable objects. (Inherited from C1.WPF.DataGrid.Filters.DataGridMultiLineItem)
	HasAnimatedProperties	(Inherited from System.Windows.UIElement)
	Height	(Inherited from System.Windows.FrameworkElement)
	HorizontalAlignment	(Inherited from System.Windows.FrameworkElement)
	HorizontalContentAlignment	(Inherited from System.Windows.Controls.Control)
	InputBackground	Gets or sets the **System.Windows.Media.Brush** that fills the background of the input control. (Inherited from C1.WPF.DataGrid.Filters.DataGridMultiLineItem)
	InputBindings	(Inherited from System.Windows.UIElement)
	InputForeground	Gets or sets the **System.Windows.Media.Brush** applied to the text inside an input control when this text is not selected. (Inherited from C1.WPF.DataGrid.Filters.DataGridMultiLineItem)
	InputScope	(Inherited from System.Windows.FrameworkElement)
	IsArrangeValid	(Inherited from System.Windows.UIElement)
	IsEnabled	(Inherited from System.Windows.UIElement)
	IsFocused	(Inherited from System.Windows.UIElement)
	IsHitTestVisible	(Inherited from System.Windows.UIElement)
	IsInitialized	(Inherited from System.Windows.FrameworkElement)
	IsInputMethodEnabled	(Inherited from System.Windows.UIElement)

	IsKeyboardFocused	(Inherited from System.Windows.UIElement)
	IsKeyboardFocusWithin	(Inherited from System.Windows.UIElement)
	IsLoaded	(Inherited from System.Windows.FrameworkElement)
	IsManipulationEnabled	(Inherited from System.Windows.UIElement)
	IsMeasureValid	(Inherited from System.Windows.UIElement)
	IsMouseCaptured	(Inherited from System.Windows.UIElement)
	IsMouseCaptureWithin	(Inherited from System.Windows.UIElement)
	IsMouseDirectlyOver	(Inherited from System.Windows.UIElement)
	IsMouseOver	(Inherited from System.Windows.UIElement)
	IsSealed	(Inherited from System.Windows.DependencyObject)
	IsStylusCaptured	(Inherited from System.Windows.UIElement)
	IsStylusCaptureWithin	(Inherited from System.Windows.UIElement)
	IsStylusDirectlyOver	(Inherited from System.Windows.UIElement)
	IsStylusOver	(Inherited from System.Windows.UIElement)
	IsTabStop	(Inherited from System.Windows.Controls.Control)
	IsVisible	(Inherited from System.Windows.UIElement)
	Language	(Inherited from System.Windows.FrameworkElement)
	LayoutTransform	(Inherited from System.Windows.FrameworkElement)
	Margin	(Inherited from System.Windows.FrameworkElement)

	MaxHeight	(Inherited from System.Windows.FrameworkElement)
	MaxWidth	(Inherited from System.Windows.FrameworkElement)
	MinHeight	(Inherited from System.Windows.FrameworkElement)
	MinWidth	(Inherited from System.Windows.FrameworkElement)
	MouseOverBrush	Gets or sets the **System.Windows.Media.Brush** used to highlight the control when it has the mouse over. (Inherited from C1.WPF.DataGrid.Filters.DataGridMultiLineItem)
	Name	(Inherited from System.Windows.FrameworkElement)
	Opacity	(Inherited from System.Windows.UIElement)
	OpacityMask	(Inherited from System.Windows.UIElement)
	Operation	Gets or sets the operation.
	Operations	Gets the operations available for this item.
	OverridesDefaultStyle	(Inherited from System.Windows.FrameworkElement)
	Padding	(Inherited from System.Windows.Controls.Control)
	Parent	(Inherited from System.Windows.FrameworkElement)
	PersistId	(Inherited from System.Windows.UIElement)
	PressedBrush	Gets or sets the **System.Windows.Media.Brush** used to paint a button when it is pressed. (Inherited from C1.WPF.DataGrid.Filters.DataGridMultiLineItem)
	RenderSize	(Inherited from System.Windows.UIElement)
	RenderTransform	(Inherited from System.Windows.UIElement)

	RenderTransformOrigin	(Inherited from System.Windows.UIElement)
	Resources	(Inherited from System.Windows.FrameworkElement)
	SelectedBackground	Gets or sets the **System.Windows.Media.Brush** used to highlight the control when it is selected. (Inherited from C1.WPF.DataGrid.Filters.DataGridMultiLineItem)
	SnapsToDevicePixels	(Inherited from System.Windows.UIElement)
	Style	(Inherited from System.Windows.FrameworkElement)
	TabIndex	(Inherited from System.Windows.Controls.Control)
	Tag	(Inherited from System.Windows.FrameworkElement)
	Template	(Inherited from System.Windows.Controls.Control)
	TemplatedParent	(Inherited from System.Windows.FrameworkElement)
	TimeFormat	Specifies the C1TimeEditorFormat format that is used to display the selected time.
	ToolTip	(Inherited from System.Windows.FrameworkElement)
	TouchesCaptured	(Inherited from System.Windows.UIElement)
	TouchesCapturedWithin	(Inherited from System.Windows.UIElement)
	TouchesDirectlyOver	(Inherited from System.Windows.UIElement)
	TouchesOver	(Inherited from System.Windows.UIElement)
	Triggers	(Inherited from System.Windows.FrameworkElement)
	Uid	(Inherited from System.Windows.UIElement)
	UseLayoutRounding	(Inherited from System.Windows.FrameworkElement)

	Value	Gets or sets the value in the operand on the right of the operation.
	VerticalAlignment	(Inherited from System.Windows.FrameworkElement)
	VerticalContentAlignment	(Inherited from System.Windows.Controls.Control)
	Visibility	(Inherited from System.Windows.UIElement)
	Width	(Inherited from System.Windows.FrameworkElement)

DataGridMultiLineDateTimeItem Class
C1.WPF.DataGrid.Filters Namespace

DataGridMultiLineDateTimeItem Constructor

Initializes a new instance of the DataGridMultiLineNumericItem class.

Syntax

Visual Basic (Declaration)
`Public Function New()`
C#

```
public DataGridMultiLineDateTimeItem()
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CustomDateFormat Property

Gets or sets the format of the date picker.

Syntax

Visual Basic (Declaration)

```
Public Property CustomDateFormat As System.String
```

C#

```
public System.string CustomDateFormat {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CustomTimeFormat Property

Gets or sets the format of the time editor.

Syntax

Visual Basic (Declaration)

```
Public Property CustomTimeFormat As System.String
```

C#

```
public System.string CustomTimeFormat {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

DateFormat Property

Specifies the DatePickerFormat format that is used to display the selected date.

Syntax

Visual Basic (Declaration)

```
Public Property DateFormat As System.Windows.Controls.DatePickerFormat
```

C#

```
public System.Windows.Controls.DatePickerFormat DateFormat {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

EditMode Property

Defines edit mode.

Syntax

Visual Basic (Declaration)

```
Public Property EditMode As DataGridDateTimeColumnEditMode
```

C#

```
public DataGridDateTimeColumnEditMode EditMode {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

FirstDayOfWeek Property

Gets or sets the day that is considered the beginning of the week.

Syntax

Visual Basic (Declaration)

```
Public Property FirstDayOfWeek As System.DayOfWeek
```

C#

```
public System.DayOfWeek FirstDayOfWeek {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Operation Property

Gets or sets the operation.

Syntax

Visual Basic (Declaration)

```
Public Property Operation As DataGridFilterOperation
```

C#

```
public DataGridFilterOperation Operation {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Operations Property

Gets the operations available for this item.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property Operations As System.Collections.Generic.List(Of
NumericComparator)
```

C#

```
public System.Collections.Generic.List<NumericComparator> Operations {get;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

TimeFormat Property

Specifies the C1TimeEditorFormat format that is used to display the selected time.

Syntax

Visual Basic (Declaration)

```
Public Property TimeFormat As C1.WPF.DateTimeEditors.C1TimeEditorFormat
```

C#

```
public C1.WPF.DateTimeEditors.C1TimeEditorFormat TimeFormat {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

PropertyChanged Event

Occurs when a property value changes.

Syntax

Visual Basic (Declaration)	
`Public Event PropertyChanged As System.ComponentModel.PropertyChangedEventHandler`	
C#	
`public event System.ComponentModel.PropertyChangedEventHandler PropertyChanged`	

Event Data

The event handler receives an argument of type System.ComponentModel.PropertyChangedEventArgs containing data related to this event. The following **PropertyChangedEventArgs** properties provide information specific to this event.

Property	Description
PropertyName	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

SetCustomDefaultValues Method

Sets the custom default values.

Syntax

Visual Basic (Declaration)	

```
Public Sub SetCustomDefaultValues()
```

C#

```
public void SetCustomDefaultValues()
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Filter Property

Gets or sets the filter shown in the unity.

Syntax

Visual Basic (Declaration)

```
Public Property Filter As DataGridFilterState
```

C#

```
public DataGridFilterState Filter {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

FocusBrush Property

Gets or sets the **System.Windows.Media.Brush** used to highlight the focused control.

Syntax

Visual Basic (Declaration)

```
Public Property FocusBrush As System.Windows.Media.Brush
```

C#

```
public System.Windows.Media.Brush FocusBrush {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Format Property

Gets or sets the format used in each item.

Syntax

Visual Basic (Declaration)

```
Public Property Format As System.String
```

C#

```
public System.string Format {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

MaxLines Property

Gets or sets the maximum number of lines that can be shown in the filter.

Syntax

Visual Basic (Declaration)

```
Public Property MaxLines As System.Integer
```

C#

```
public System.int MaxLines {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Gets or sets the **System.Windows.Media.Brush** used to paint a button when it is pressed.

Syntax

Visual Basic (Declaration)	
`Public Property PressedBrush As System.Windows.Media.Brush`	
C#	
`public System.Windows.Media.Brush PressedBrush {get; set;}`	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

SelectedBackground Property

Gets or sets the **System.Windows.Media.Brush** used to highlight the control when it is selected.

Syntax

Visual Basic (Declaration)

```
Public Property SelectedBackground As System.Windows.Media.Brush
```

C#

```
public System.Windows.Media.Brush SelectedBackground {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

PropertyChanged Event

Occurs when a property value changes.

Syntax

Visual Basic (Declaration)
`Public Event PropertyChanged As System.ComponentModel.PropertyChangedEventHandler`
C#
`public event System.ComponentModel.PropertyChangedEventHandler PropertyChanged`

Event Data

The event handler receives an argument of type System.ComponentModel.PropertyChangedEventArgs containing data related to this event. The following **PropertyChangedEventArgs** properties provide information specific to this event.

Property	Description
PropertyName	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

FocusBrush Property

Gets or sets the **System.Windows.Media.Brush** used to highlight the focused control.

Syntax

Visual Basic (Declaration)	
`Public Property FocusBrush As System.Windows.Media.Brush`	
C#	

```
public System.Windows.Media.Brush FocusBrush {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Format Property

Gets or sets the format used to display formatable objects.

Syntax

Visual Basic (Declaration)

```
Public Property Format As System.String
```

C#

```
public System.string Format {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

DataGridMultiLineNumericFilter Class
C1.WPF.DataGrid.Filters Namespace

DataGridMultiLineNumericFilter Constructor

Initializes a new instance of the DataGridMultiLineNumericFilter class.

Syntax

Visual Basic (Declaration)

```
Public Function New()
```

C#

```
public DataGridMultiLineNumericFilter()
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

DataGridMultiLineNumericItem Constructor

Initializes a new instance of the DataGridMultiLineNumericItem class.

Syntax

Visual Basic (Declaration)	
`Public Function New()`	
C#	
`public DataGridMultiLineNumericItem()`	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

PropertyChanged Event

Occurs when a property value changes.

Syntax

Visual Basic (Declaration)	
`Public Event PropertyChanged As System.ComponentModel.PropertyChangedEventHandler`	
C#	
`public event System.ComponentModel.PropertyChangedEventHandler PropertyChanged`	

Event Data

The event handler receives an argument of type System.ComponentModel.PropertyChangedEventArgs containing data related to this event. The following **PropertyChangedEventArgs** properties provide information specific to this event.

Property	Description
PropertyName	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

C1.WPF.DataGrid.Filters Namespace

DataGridMultiLineTextItem Constructor

Initializes a new instance of the DataGridMultiLineNumericItem class.

Syntax

Visual Basic (Declaration)
`Public Function New()`
C#
`public DataGridMultiLineTextItem()`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Operation Property

Gets or sets the operation.

Syntax

Visual Basic (Declaration)

```
Public Property Operation As DataGridFilterOperation
```

C#

```
public DataGridFilterOperation Operation {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

PropertyChanged Event

Occurs when a property value changes.

Syntax

Visual Basic (Declaration)
`Public Event PropertyChanged As System.ComponentModel.PropertyChangedEventHandler`
C#
`public event System.ComponentModel.PropertyChangedEventHandler PropertyChanged`

Event Data

The event handler receives an argument of type System.ComponentModel.PropertyChangedEventArgs containing data related to this event. The following **PropertyChangedEventArgs** properties provide information specific to this event.

Property	Description
PropertyName	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

BuildFilterState Method
The column target of the filter state.

The filter criteria.

Builds the filter state from a string.

Syntax

Visual Basic (Declaration)

```
Public Shared Function BuildFilterState( _
   ByVal column As DataGridColumn, _
   ByVal text As System.String _
) As DataGridFilterState
```

C#

```
public static DataGridFilterState BuildFilterState(
   DataGridColumn column,
   System.string text
)
```

Parameters

column

The column target of the filter state.

text

The filter criteria.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

C1.WPF.DataGrid.Summaries Namespace

Overview

Classes

	Class	Description

	C1GroupingWithSummariesBehavior	Makes each group row to show the summaries specified in the attached collection of aggregate functions.
	DataGridAggregate	Represents an abstract aggregate function.
	DataGridAggregateAvg	Computes the average of the items in a row collection
	DataGridAggregateCount	Computes the count of the items in a row collection
	DataGridAggregateDistinct	Computes the count of distinct items among the items of a row collection
	DataGridAggregateMax	Computes the maximum among the items of a row collection
	DataGridAggregateMin	Computes the minimum among the items of a row collection
	DataGridAggregatesCollection	Collection of aggregate functions. This collection is typically used in xaml to enclose the aggregate function declarations.
	DataGridAggregateSum	Computes the sum of the items in a row collection
	DataGridAggregateWithFormat	Aggregate function which result will be formated with the column format property.
	DataGridGroupWithSummaryRow	Grouping row which displays summaries in the row itself in addition to the classic grouping title and expand/collapse button.
	DataGridGroupWithSummaryRowPresenter	Visual representation of a group row which contains summaries.

	DataGridSummaryRow	Display the summaries for each column that has aggregate functions attached. This row can be seen inside a group or not, in all cases will compute the value of all the items recursively. e.g. if this row is added inside a group row the sum function will display the sum of all the items inside that group and the items that are in a sub group of it.

Compute Method

The rows collection to which the aggregate function is applied.

The column to which the aggregate function is applied.

if set to `true` the function must be applied to sub groups recursively.

Execute the aggregate function.

Syntax

Visual Basic (Declaration)

```
Public MustOverride Function Compute( _
   ByVal rows As DataGridRowCollection, _
   ByVal column As DataGridColumn, _
   ByVal recursive As System.Boolean _
) As System.Object
```

C#

```
public abstract System.object Compute(
   DataGridRowCollection rows,
   DataGridColumn column,
   System.bool recursive
)
```

Parameters

rows

The rows collection to which the aggregate function is applied.

column

The column to which the aggregate function is applied.

recursive

if set to `true` the function must be applied to sub groups recursively.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

DataGridAggregate Members

GetAggregateFunctions Method
The column to which the aggregate functions are applied.

Gets the collection of aggregate functions applied to the corresponding column.

Syntax

Visual Basic (Declaration)

```
Public Shared Function GetAggregateFunctions( _
   ByVal column As DataGridColumn _
) As DataGridAggregatesCollection
```

C#

```
public static DataGridAggregatesCollection GetAggregateFunctions(
   DataGridColumn column
)
```

Parameters

column

The column to which the aggregate functions are applied.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

GetDataTemplateFromString Method
The string format.

Gets a from a string formatted(Only "{0}" is accepted). "SUM = {0}"

Syntax

Visual Basic (Declaration)

```
Public Shared Function GetDataTemplateFromString( _
   ByVal stringFormat As System.String _
) As System.Windows.DataTemplate
```

C#

```
public static System.Windows.DataTemplate GetDataTemplateFromString(
   System.string stringFormat
)
```

Parameters

stringFormat

The string format.

Example

"SUM = {0}"

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

DataGridAggregate Members
System.Windows.DataTemplate

GetResult Method
The rows to which the aggregate function will be applied.

The column to which the aggregate function is applied.

if set to `true` the aggregate function will be applied recursively over the rows collection.

Gets a **System.Windows.Controls.ContentPresenter** that contains the result of the aggregate function with the corresponding template applied.

Syntax

Visual Basic (Declaration)

```
Public Overridable Function GetResult( _
   ByVal rows As DataGridRowCollection, _
   ByVal column As DataGridColumn, _
   ByVal recursive As System.Boolean _
) As System.Windows.Controls.ContentPresenter
```

C#

```
public virtual System.Windows.Controls.ContentPresenter GetResult(
   DataGridRowCollection rows,
   DataGridColumn column,
   System.bool recursive
)
```

Parameters

rows

The rows to which the aggregate function will be applied.

column

The column to which the aggregate function is applied.

recursive

if set to `true` the aggregate function will be applied recursively over the rows collection.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GetResultText Method

The rows to which the aggregate function will be applied.

The column to which the aggregate function is applied.

if set to `true` the aggregate function will be applied recursively over the rows collection.

Gets the text containing the result of the aggregate function after the ResultFormat is applied.

Syntax

Visual Basic (Declaration)

```
Public Overridable Function GetResultText( _
   ByVal rows As DataGridRowCollection, _
   ByVal column As DataGridColumn, _
   ByVal recursive As System.Boolean _
) As System.String
```

C#

```
public virtual System.string GetResultText(
   DataGridRowCollection rows,
   DataGridColumn column,
   System.bool recursive
)
```

Parameters

rows

The rows to which the aggregate function will be applied.

column

The column to which the aggregate function is applied.

recursive

if set to `true` the aggregate function will be applied recursively over the rows collection.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

SetAggregateFunctions Method

The column to which the aggregate functions will be applied.

The collection of aggregate functions that will be applied to the column.

Sets the collection of aggregate functions that will be applied to the column.

Syntax

Visual Basic (Declaration)

```
Public Shared Sub SetAggregateFunctions( _
   ByVal column As DataGridColumn, _
   ByVal aggregates As DataGridAggregatesCollection _
)
```

C#

```
public static void SetAggregateFunctions(
   DataGridColumn column,
   DataGridAggregatesCollection aggregates
)
```

Parameters

column

The column to which the aggregate functions will be applied.

aggregates

The collection of aggregate functions that will be applied to the column.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ResultFormat Property

Gets or sets the text that will be shown in the cell, the ocurrences of the text "{0}" will be replaced with the result of the aggregate function.

Syntax

Visual Basic (Declaration)

```
Public Property ResultFormat As System.String
```

C#

```
public System.string ResultFormat {get; set;}
```

Remarks

if ResultTemplate property is specified, this property is ignored.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ResultTemplate Property

Gets or sets the data template that will be applied to the result of the aggregate function.

Syntax

Visual Basic (Declaration)

```
Public Property ResultTemplate As System.Windows.DataTemplate
```

C#

```
public System.Windows.DataTemplate ResultTemplate {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Compute Method

The rows collection to which the aggregate function is applied.

The column to which the aggregate function is applied.

if set to `true` the function must be applied to sub groups recursively.

Computes the average of the values in the rows collection corresponding to the specified column.

Syntax

Visual Basic (Declaration)

```
Public Overrides Function Compute( _
   ByVal rows As DataGridRowCollection, _
   ByVal column As DataGridColumn, _
   ByVal recursive As System.Boolean _
) As System.Object
```

C#

```
public override System.object Compute(
   DataGridRowCollection rows,
   DataGridColumn column,
   System.bool recursive
)
```

Parameters

rows

The rows collection to which the aggregate function is applied.

column

The column to which the aggregate function is applied.

recursive

if set to `true` the function must be applied to sub groups recursively.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Compute Method

The rows collection to which the aggregate function is applied.

The column to which the aggregate function is applied.

if set to `true` the function must be applied to sub groups recursively.

Computes the maximum value in the rows collection corresponding to the specified column.

Syntax

Visual Basic (Declaration)

```
Public Overrides Function Compute( _
   ByVal rows As DataGridRowCollection, _
   ByVal column As DataGridColumn, _
   ByVal recursive As System.Boolean _
) As System.Object
```

C#

```
public override System.object Compute(
   DataGridRowCollection rows,
   DataGridColumn column,
   System.bool recursive
)
```

Parameters

rows

The rows collection to which the aggregate function is applied.

column

The column to which the aggregate function is applied.

recursive

if set to `true` the function must be applied to sub groups recursively.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Public Constructors

	Name	Description
	DataGridGroupWithSummaryRow Constructor	Initializes a new instance of the DataGridGroupWithSummaryRow class.

Top

Public Properties

	Name	Description
	ActualCanUserToggleDetails	Gets or sets a value indicating whether the user can toggle details, taking in consideration properties of the containing DataGrid. (Inherited from C1.WPF.DataGrid.DataGridRow)
	ActualDetailsVisibility	Gets a value indicating whether this row is showing details, taking in consideration properties of the containing DataGrid. (Inherited from C1.WPF.DataGrid.DataGridRow)
	ActualHeight	Gets the actual height in pixels. (Inherited from C1.WPF.DataGrid.DataGridRow)
	ActualHeightWithoutDetails	Gets the actual height in pixels (without the details). (Inherited from C1.WPF.DataGrid.DataGridRow)
	CanUserResize	Gets or sets a value indicating whether this row can be resized by the user. (Inherited from C1.WPF.DataGrid.DataGridRow)
	CanUserToggleDetails	Gets or sets a value indicating whether the user can toggle details. (Inherited from C1.WPF.DataGrid.DataGridRow)
	CellStyle	Gets or sets the style applied to all the cells of this row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Column	Gets the column related to the group. (Inherited from C1.WPF.DataGrid.DataGridGroupRow)
	DataGrid	Gets the data grid to which the row belongs. (Inherited from C1.WPF.DataGrid.DataGridRow)
	DataItem	Gets the data of the row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	DependencyObjectType	(Inherited from System.Windows.DependencyObject)

	DetailsPresenter	Gets the visual element that will be arranged at the bottom of the row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	DetailsVisibility	Gets or sets a value indicating whether this row is showing details. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Dispatcher	(Inherited from System.Windows.Threading.DispatcherObject)
	Errors	Gets the collection of errors associated with this row. Add errors here if you want to display an error message in the corresponding row header. (Inherited from C1.WPF.DataGrid.DataGridRow)
	GroupKeys	Gets keys that identify the group. (Inherited from C1.WPF.DataGrid.DataGridGroupRow)
	GroupRowsVisibility	Gets or sets the visibility of the rows related to the group. (Inherited from C1.WPF.DataGrid.DataGridGroupRow)
	HeaderPresenter	Gets the visual element that represent the header of this row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Height	Gets or sets the height of this row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	IndentWidth	Gets the distance between the row header and the first cell of the row. This empty space is only present when there are groups in the data grid. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Index	Gets the index of the row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	IsEditable	Gets a value indicating whether this row is editable. (Inherited from C1.WPF.DataGrid.DataGridRow)

	IsEditing	Gets or sets a value indicating whether this row is editing. (Inherited from C1.WPF.DataGrid.DataGridRow)
	IsMouseOver	Gets a value indicating whether the mouse is over the row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	IsSealed	(Inherited from System.Windows.DependencyObject)
	IsSelectable	Gets or sets a value indicating whether the user is allowed to set the current cell from this row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	IsSelected	Gets a value indicating whether this row is selected. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Level	(Inherited from C1.WPF.DataGrid.DataGridGroupRow)
	MaxHeight	Gets or sets the maximum height (in pixels) allowed. (Inherited from C1.WPF.DataGrid.DataGridRow)
	MinHeight	Gets or sets the minimum height (in pixels) allowed. (Inherited from C1.WPF.DataGrid.DataGridRow)
	ParentCollection	Gets the collection of rows to which this row belongs. (Inherited from C1.WPF.DataGrid.DataGridRow)
	ParentGroup	Gets the parent group. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Presenter	Gets the visual element that represent this row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	RowHeaderStyle	Gets or sets the style applied to the row header presenter of this row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Rows	Gets the rows inside the group. (Inherited from C1.WPF.DataGrid.DataGridGroupRow)

	RowStyle	Gets or sets the style of the row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	ShowVerticalFreezingSeparator	Gets a value indicating whether to show vertical freezing separator. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Type	Gets the type of row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	ValidationResults	Gets the collection of errors associated with this row. Add errors here if you want to display an error message in the corresponding row header. (Inherited from C1.WPF.DataGrid.DataGridRow)
	VerticalOffset	Gets the vertical offset in pixels. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Visibility	Gets or sets the visibility of the row. (Inherited from C1.WPF.DataGrid.DataGridRow)

Public Methods

	Name	Description
	ClearValue	Overloaded. (Inherited from System.Windows.DependencyObject)
	CoerceValue	(Inherited from System.Windows.DependencyObject)
	Equals	(Inherited from System.Windows.DependencyObject)
	GetCellPresenter	(Inherited from C1.WPF.DataGrid.DataGridRow)
	GetGroupText	(Inherited from C1.WPF.DataGrid.DataGridGroupRow)
	GetHashCode	(Inherited from System.Windows.DependencyObject)

	GetLocalValueEnumerator	(Inherited from System.Windows.DependencyObject)
	GetValue	(Inherited from System.Windows.DependencyObject)
	InvalidateProperty	(Inherited from System.Windows.DependencyObject)
	ReadLocalValue	(Inherited from System.Windows.DependencyObject)
	Refresh	Unload every visual element which is related to the row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	SetCurrentValue	(Inherited from System.Windows.DependencyObject)
	SetValue	Overloaded. (Inherited from System.Windows.DependencyObject)
	ToString	Returns a **System.String** that represents the current **System.Object**. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Validate	Overloaded. Validates the DataItem. Implement IDataErrorInfo or INotifyDataErrorInfo in order to implement your own validation rules. (Inherited from C1.WPF.DataGrid.DataGridRow)

Top

Public Events

	Name	Description
	CanUserResizeChanged	Occurs after the CanUserResize value changed. (Inherited from C1.WPF.DataGrid.DataGridRow)
	CanUserToggleDetailsChanged	Occurs after the CanUserToggleDetails value changed. (Inherited from C1.WPF.DataGrid.DataGridRow)
	DetailsVisibilityChanged	Occurs after the visibility of the details of the row changed. (Inherited from C1.WPF.DataGrid.DataGridRow)

	GroupRowsVisibilityChanged	Occurs when the rows related to the group visibility changed. (Inherited from C1.WPF.DataGrid.DataGridGroupRow)
	HeightChanged	Occurs after the height was changed. (Inherited from C1.WPF.DataGrid.DataGridRow)
	IsEditingChanged	Occurs when the IsEditing value changed. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Loaded	Occurs after the row is added to the collection of rows. (Inherited from C1.WPF.DataGrid.DataGridRow)
	PropertyChanged	Occurs when a property value changes. (Inherited from C1.WPF.DataGrid.DataGridRow)
	VisibilityChanged	Occurs after the visibility of the row changed. (Inherited from C1.WPF.DataGrid.DataGridRow)

Members

Fields Properties Methods Events

The following tables list the members exposed by DataGridGroupWithSummaryRowPresenter.

Public Constructors

	Name	Description
	DataGridGroupWithSummaryRowPresenter Constructor	Initializes a new instance of the DataGridGroupWithSummaryRowPresenter class.

Top

Public Fields

	Name	Description
	LeadingMarginProperty	Gets or sets the margin between the first column and the rows headers, this space is only visible when there are grouped columns.

Top

Public Properties

	Name	Description
	ActualHeight	(Inherited from System.Windows.FrameworkElement)
	ActualWidth	(Inherited from System.Windows.FrameworkElement)

	AllowDrop	(Inherited from System.Windows.UIElement)
	AreAnyTouchesCaptured	(Inherited from System.Windows.UIElement)
	AreAnyTouchesCapturedWithin	(Inherited from System.Windows.UIElement)
	AreAnyTouchesDirectlyOver	(Inherited from System.Windows.UIElement)
	AreAnyTouchesOver	(Inherited from System.Windows.UIElement)
	Background	(Inherited from System.Windows.Controls.Control)
	BackgroundBrush	Gets or sets the **System.Windows.Media.Brush** used in the background of the row. (Inherited from C1.WPF.DataGrid.DataGridRowPresenter)
	BindingGroup	(Inherited from System.Windows.FrameworkElement)
	BitmapEffect	(Inherited from System.Windows.UIElement)
	BitmapEffectInput	(Inherited from System.Windows.UIElement)
	BorderBrush	(Inherited from System.Windows.Controls.Control)
	BorderThickness	(Inherited from System.Windows.Controls.Control)
	ButtonBackground	Gets or sets the **System.Windows.Media.Brush** that will be assigned to the Background of the buttons inside the control. (Inherited from C1.WPF.DataGrid.DataGridGroupRowPresenter)
	ButtonForeground	Gets or sets the **System.Windows.Media.Brush** that will be assigned to the Foreground of the buttons inside the control. (Inherited from C1.WPF.DataGrid.DataGridGroupRowPresenter)
	CacheMode	(Inherited from System.Windows.UIElement)

	CellsAreaMargin	Gets or sets a **Margin** that can be applied to a **System.Windows.UIElement** locating the element in the area where the cells are shown, typically this margin is applied to the cells panel. (Inherited from C1.WPF.DataGrid.DataGridRowPresenter)
	CellsPanel	Gets the cells panel inside this row presenter. (Inherited from C1.WPF.DataGrid.DataGridRowPresenter)
	Clip	(Inherited from System.Windows.UIElement)
	ClipToBounds	(Inherited from System.Windows.UIElement)
	CommandBindings	(Inherited from System.Windows.UIElement)
	ContextMenu	(Inherited from System.Windows.FrameworkElement)
	Cursor	(Inherited from System.Windows.FrameworkElement)
	DataContext	(Inherited from System.Windows.FrameworkElement)
	DataGrid	Gets the data grid associated with this presenter. (Inherited from C1.WPF.DataGrid.DataGridRowPresenter)
	DependencyObjectType	(Inherited from System.Windows.DependencyObject)
	DesiredSize	(Inherited from System.Windows.UIElement)
	Dispatcher	(Inherited from System.Windows.Threading.DispatcherObject)
	Effect	(Inherited from System.Windows.UIElement)
	FlowDirection	(Inherited from System.Windows.FrameworkElement)
	Focusable	(Inherited from System.Windows.UIElement)
	FocusVisualStyle	(Inherited from System.Windows.FrameworkElement)

	FontFamily	(Inherited from System.Windows.Controls.Control)
	FontSize	(Inherited from System.Windows.Controls.Control)
	FontStretch	(Inherited from System.Windows.Controls.Control)
	FontStyle	(Inherited from System.Windows.Controls.Control)
	FontWeight	(Inherited from System.Windows.Controls.Control)
	ForceCursor	(Inherited from System.Windows.FrameworkElement)
	Foreground	(Inherited from System.Windows.Controls.Control)
	GroupContent	Gets or sets the text or uielement displayed as the title of the group (Inherited from C1.WPF.DataGrid.DataGridGroupRowPresenter)
	GroupContentMargin	Gets or sets the margin applied to the group title and collapse/expand checkbox. (Inherited from C1.WPF.DataGrid.DataGridGroupRowPresenter)
	HasAnimatedProperties	(Inherited from System.Windows.UIElement)
	Height	(Inherited from System.Windows.FrameworkElement)
	HorizontalAlignment	(Inherited from System.Windows.FrameworkElement)
	HorizontalContentAlignment	(Inherited from System.Windows.Controls.Control)
	HorizontalGridLineBrush	Gets or sets the **System.Windows.Media.Brush** used to highlight the horizontal grid lines. (Inherited from C1.WPF.DataGrid.DataGridRowPresenter)
	HorizontalGridLineOpacity	Gets or sets the opacity of the horizontal grid line. (Inherited from C1.WPF.DataGrid.DataGridRowPresenter)
	HorizontalGridLineVisibility	Gets or sets the visibility of the horizontal grid lines of this

		row, If true, the horizontal grid lines are shown. (Inherited from C1.WPF.DataGrid.DataGridRowPresenter)
	InputBindings	(Inherited from System.Windows.UIElement)
	InputScope	(Inherited from System.Windows.FrameworkElement)
	IsArrangeValid	(Inherited from System.Windows.UIElement)
	IsChecked	Gets or sets whether this group is expanded or collapsed. (Inherited from C1.WPF.DataGrid.DataGridGroupRowPresenter)
	IsEditing	Gets or sets a value indicating whether this cell is currently editing. (Inherited from C1.WPF.DataGrid.DataGridSelectableRowPresenter)
	IsEnabled	(Inherited from System.Windows.UIElement)
	IsFocused	(Inherited from System.Windows.UIElement)
	IsHitTestVisible	(Inherited from System.Windows.UIElement)
	IsInitialized	(Inherited from System.Windows.FrameworkElement)
	IsInputMethodEnabled	(Inherited from System.Windows.UIElement)
	IsKeyboardFocused	(Inherited from System.Windows.UIElement)
	IsKeyboardFocusWithin	(Inherited from System.Windows.UIElement)
	IsLoaded	(Inherited from System.Windows.FrameworkElement)
	IsManipulationEnabled	(Inherited from System.Windows.UIElement)
	IsMeasureValid	(Inherited from System.Windows.UIElement)
	IsMouseCaptured	(Inherited from System.Windows.UIElement)

	IsMouseCaptureWithin	(Inherited from System.Windows.UIElement)
	IsMouseDirectlyOver	(Inherited from System.Windows.UIElement)
	IsMouseOver	(Inherited from System.Windows.UIElement)
	IsSealed	(Inherited from System.Windows.DependencyObject)
	IsSelected	Gets or sets a value indicating whether this cell is currently selected. (Inherited from C1.WPF.DataGrid.DataGridSelectableRowPresenter)
	IsStylusCaptured	(Inherited from System.Windows.UIElement)
	IsStylusCaptureWithin	(Inherited from System.Windows.UIElement)
	IsStylusDirectlyOver	(Inherited from System.Windows.UIElement)
	IsStylusOver	(Inherited from System.Windows.UIElement)
	IsTabStop	(Inherited from System.Windows.Controls.Control)
	IsVisible	(Inherited from System.Windows.UIElement)
	Item	Gets the C1.WPF.DataGrid.DataGridCellPresenter with the specified column. (Inherited from C1.WPF.DataGrid.DataGridRowPresenter)
	Language	(Inherited from System.Windows.FrameworkElement)
	LayoutTransform	(Inherited from System.Windows.FrameworkElement)
	LeadingMargin	Gets or sets the margin between the first column and the rows headers, this space is only visible when there are grouped columns.
	Margin	(Inherited from System.Windows.FrameworkElement)

	MaxHeight	(Inherited from System.Windows.FrameworkElement)
	MaxWidth	(Inherited from System.Windows.FrameworkElement)
	MinHeight	(Inherited from System.Windows.FrameworkElement)
	MinWidth	(Inherited from System.Windows.FrameworkElement)
	MouseOverBrush	Gets or sets the **System.Windows.Media.Brush** used to highlight the control when it has the mouse over. (Inherited from C1.WPF.DataGrid.DataGridSelectableRowPresenter)
	Name	(Inherited from System.Windows.FrameworkElement)
	Opacity	(Inherited from System.Windows.UIElement)
	OpacityMask	(Inherited from System.Windows.UIElement)
	OverridesDefaultStyle	(Inherited from System.Windows.FrameworkElement)
	Padding	(Inherited from System.Windows.Controls.Control)
	Parent	(Inherited from System.Windows.FrameworkElement)
	PersistId	(Inherited from System.Windows.UIElement)
	PressedBrush	Gets or sets the **System.Windows.Media.Brush** used to paint a button when it is pressed. (Inherited from C1.WPF.DataGrid.DataGridSelectableRowPresenter)
	RenderSize	(Inherited from System.Windows.UIElement)
	RenderTransform	(Inherited from System.Windows.UIElement)
	RenderTransformOrigin	(Inherited from System.Windows.UIElement)
	Resources	(Inherited from System.Windows.FrameworkElement)

	Row	Gets the row associated with this presenter. (Inherited from C1.WPF.DataGrid.DataGridRowPresenter)
	RowAreaMargin	Gets or sets a **Margin** that can be applied to a **System.Windows.UIElement** inside a row presenter ensuring the element won't be scrolled even whether the row is scrollable. (Inherited from C1.WPF.DataGrid.DataGridRowPresenter)
	SelectedBackground	Gets or sets the **System.Windows.Media.Brush** used to highlight the control when it is selected. (Inherited from C1.WPF.DataGrid.DataGridSelectableRowPresenter)
	SnapsToDevicePixels	(Inherited from System.Windows.UIElement)
	Style	(Inherited from System.Windows.FrameworkElement)
	TabIndex	(Inherited from System.Windows.Controls.Control)
	Tag	(Inherited from System.Windows.FrameworkElement)
	Template	(Inherited from System.Windows.Controls.Control)
	TemplatedParent	(Inherited from System.Windows.FrameworkElement)
	ToolTip	(Inherited from System.Windows.FrameworkElement)
	TouchesCaptured	(Inherited from System.Windows.UIElement)
	TouchesCapturedWithin	(Inherited from System.Windows.UIElement)
	TouchesDirectlyOver	(Inherited from System.Windows.UIElement)
	TouchesOver	(Inherited from System.Windows.UIElement)
	Triggers	(Inherited from System.Windows.FrameworkElement)
	Uid	(Inherited from System.Windows.UIElement)

	UseLayoutRounding	(Inherited from System.Windows.FrameworkElement)
	ValidationBackground	Gets or sets the brush used to paint the background of the validation elements. (Inherited from C1.WPF.DataGrid.DataGridRowPresenter)
	ValidationResults	Gets or sets a collection of ValidationResult related to the corresponding row. When the number of errors is greater than 0 the background of the row will became red. (Inherited from C1.WPF.DataGrid.DataGridRowPresenter)
	ValidationState	Gets or sets the ValidationState. (Inherited from C1.WPF.DataGrid.DataGridRowPresenter)
	VerticalAlignment	(Inherited from System.Windows.FrameworkElement)
	VerticalContentAlignment	(Inherited from System.Windows.Controls.Control)
	VerticalGridLineBrush	Gets or sets the **System.Windows.Media.Brush** used to highlight the vertical grid lines. (Inherited from C1.WPF.DataGrid.DataGridRowPresenter)
	VerticalGridLineVisibility	Gets or sets the visibility of the vertical grid lines of this row, If true, the vertical grid lines are shown. (Inherited from C1.WPF.DataGrid.DataGridRowPresenter)
	Visibility	(Inherited from System.Windows.UIElement)
	Width	(Inherited from System.Windows.FrameworkElement)

DataGridGroupWithSummaryRowPresenter Class
C1.WPF.DataGrid.Summaries Namespace

DataGridGroupWithSummaryRowPresenter Constructor

Initializes a new instance of the DataGridGroupWithSummaryRowPresenter class.

Syntax

Visual Basic (Declaration)	
`Public Function New()`	
C#	
`public DataGridGroupWithSummaryRowPresenter()`	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

>

Name	Description
ActualHeight	(Inherited from System.Windows.FrameworkElement)
ActualWidth	(Inherited from System.Windows.FrameworkElement)
AllowDrop	(Inherited from System.Windows.UIElement)
AreAnyTouchesCaptured	(Inherited from System.Windows.UIElement)
AreAnyTouchesCapturedWithin	(Inherited from System.Windows.UIElement)
AreAnyTouchesDirectlyOver	(Inherited from System.Windows.UIElement)
AreAnyTouchesOver	(Inherited from System.Windows.UIElement)
Background	(Inherited from System.Windows.Controls.Control)
BackgroundBrush	Gets or sets the **System.Windows.Media.Brush** used in the background of the row. (Inherited from C1.WPF.DataGrid.DataGridRowPresenter)
BindingGroup	(Inherited from System.Windows.FrameworkElement)

BitmapEffect	(Inherited from System.Windows.UIElement)
BitmapEffectInput	(Inherited from System.Windows.UIElement)
BorderBrush	(Inherited from System.Windows.Controls.Control)
BorderThickness	(Inherited from System.Windows.Controls.Control)
ButtonBackground	Gets or sets the **System.Windows.Media.Brush** that will be assigned to the Background of the buttons inside the control. (Inherited from C1.WPF.DataGrid.DataGridGroupRowPresenter)
ButtonForeground	Gets or sets the **System.Windows.Media.Brush** that will be assigned to the Foreground of the buttons inside the control. (Inherited from C1.WPF.DataGrid.DataGridGroupRowPresenter)
CacheMode	(Inherited from System.Windows.UIElement)
CellsAreaMargin	Gets or sets a **Margin** that can be applied to a **System.Windows.UIElement** locating the element in the area where the cells are shown, typically this margin is applied to the cells panel. (Inherited from C1.WPF.DataGrid.DataGridRowPresenter)
CellsPanel	Gets the cells panel inside this row presenter. (Inherited from C1.WPF.DataGrid.DataGridRowPresenter)
Clip	(Inherited from System.Windows.UIElement)
ClipToBounds	(Inherited from System.Windows.UIElement)
CommandBindings	(Inherited from System.Windows.UIElement)
ContextMenu	(Inherited from System.Windows.FrameworkElement)
Cursor	(Inherited from System.Windows.FrameworkElement)
DataContext	(Inherited from System.Windows.FrameworkElement)
DataGrid	Gets the data grid associated with this presenter. (Inherited from C1.WPF.DataGrid.DataGridRowPresenter)
DependencyObjectType	(Inherited from System.Windows.DependencyObject)
DesiredSize	(Inherited from System.Windows.UIElement)

Dispatcher	(Inherited from System.Windows.Threading.DispatcherObject)
Effect	(Inherited from System.Windows.UIElement)
FlowDirection	(Inherited from System.Windows.FrameworkElement)
Focusable	(Inherited from System.Windows.UIElement)
FocusVisualStyle	(Inherited from System.Windows.FrameworkElement)
FontFamily	(Inherited from System.Windows.Controls.Control)
FontSize	(Inherited from System.Windows.Controls.Control)
FontStretch	(Inherited from System.Windows.Controls.Control)
FontStyle	(Inherited from System.Windows.Controls.Control)
FontWeight	(Inherited from System.Windows.Controls.Control)
ForceCursor	(Inherited from System.Windows.FrameworkElement)
Foreground	(Inherited from System.Windows.Controls.Control)
GroupContent	Gets or sets the text or uielement displayed as the title of the group (Inherited from C1.WPF.DataGrid.DataGridGroupRowPresenter)
GroupContentMargin	Gets or sets the margin applied to the group title and collapse/expand checkbox. (Inherited from C1.WPF.DataGrid.DataGridGroupRowPresenter)
HasAnimatedProperties	(Inherited from System.Windows.UIElement)
Height	(Inherited from System.Windows.FrameworkElement)
HorizontalAlignment	(Inherited from System.Windows.FrameworkElement)
HorizontalContentAlignment	(Inherited from System.Windows.Controls.Control)
HorizontalGridLineBrush	Gets or sets the **System.Windows.Media.Brush** used to highlight the horizontal grid lines. (Inherited from C1.WPF.DataGrid.DataGridRowPresenter)
HorizontalGridLineOpacity	Gets or sets the opacity of the horizontal grid line. (Inherited from C1.WPF.DataGrid.DataGridRowPresenter)

HorizontalGridLineVisibility	Gets or sets the visibility of the horizontal grid lines of this row, If true, the horizontal grid lines are shown. (Inherited from C1.WPF.DataGrid.DataGridRowPresenter)
InputBindings	(Inherited from System.Windows.UIElement)
InputScope	(Inherited from System.Windows.FrameworkElement)
IsArrangeValid	(Inherited from System.Windows.UIElement)
IsChecked	Gets or sets whether this group is expanded or collapsed. (Inherited from C1.WPF.DataGrid.DataGridGroupRowPresenter)
IsEditing	Gets or sets a value indicating whether this cell is currently editing. (Inherited from C1.WPF.DataGrid.DataGridSelectableRowPresenter)
IsEnabled	(Inherited from System.Windows.UIElement)
IsFocused	(Inherited from System.Windows.UIElement)
IsHitTestVisible	(Inherited from System.Windows.UIElement)
IsInitialized	(Inherited from System.Windows.FrameworkElement)
IsInputMethodEnabled	(Inherited from System.Windows.UIElement)
IsKeyboardFocused	(Inherited from System.Windows.UIElement)
IsKeyboardFocusWithin	(Inherited from System.Windows.UIElement)
IsLoaded	(Inherited from System.Windows.FrameworkElement)
IsManipulationEnabled	(Inherited from System.Windows.UIElement)
IsMeasureValid	(Inherited from System.Windows.UIElement)
IsMouseCaptured	(Inherited from System.Windows.UIElement)
IsMouseCaptureWithin	(Inherited from System.Windows.UIElement)
IsMouseDirectlyOver	(Inherited from System.Windows.UIElement)
IsMouseOver	(Inherited from System.Windows.UIElement)
IsSealed	(Inherited from System.Windows.DependencyObject)

IsSelected	Gets or sets a value indicating whether this cell is currently selected. (Inherited from C1.WPF.DataGrid.DataGridSelectableRowPresenter)
IsStylusCaptured	(Inherited from System.Windows.UIElement)
IsStylusCaptureWithin	(Inherited from System.Windows.UIElement)
IsStylusDirectlyOver	(Inherited from System.Windows.UIElement)
IsStylusOver	(Inherited from System.Windows.UIElement)
IsTabStop	(Inherited from System.Windows.Controls.Control)
IsVisible	(Inherited from System.Windows.UIElement)
Item	Gets the C1.WPF.DataGrid.DataGridCellPresenter with the specified column. (Inherited from C1.WPF.DataGrid.DataGridRowPresenter)
Language	(Inherited from System.Windows.FrameworkElement)
LayoutTransform	(Inherited from System.Windows.FrameworkElement)
LeadingMargin	Gets or sets the margin between the first column and the rows headers, this space is only visible when there are grouped columns.
Margin	(Inherited from System.Windows.FrameworkElement)
MaxHeight	(Inherited from System.Windows.FrameworkElement)
MaxWidth	(Inherited from System.Windows.FrameworkElement)
MinHeight	(Inherited from System.Windows.FrameworkElement)
MinWidth	(Inherited from System.Windows.FrameworkElement)
MouseOverBrush	Gets or sets the **System.Windows.Media.Brush** used to highlight the control when it has the mouse over. (Inherited from C1.WPF.DataGrid.DataGridSelectableRowPresenter)
Name	(Inherited from System.Windows.FrameworkElement)
Opacity	(Inherited from System.Windows.UIElement)
OpacityMask	(Inherited from System.Windows.UIElement)

OverridesDefaultStyle	(Inherited from System.Windows.FrameworkElement)
Padding	(Inherited from System.Windows.Controls.Control)
Parent	(Inherited from System.Windows.FrameworkElement)
PersistId	(Inherited from System.Windows.UIElement)
PressedBrush	Gets or sets the **System.Windows.Media.Brush** used to paint a button when it is pressed. (Inherited from C1.WPF.DataGrid.DataGridSelectableRowPresenter)
RenderSize	(Inherited from System.Windows.UIElement)
RenderTransform	(Inherited from System.Windows.UIElement)
RenderTransformOrigin	(Inherited from System.Windows.UIElement)
Resources	(Inherited from System.Windows.FrameworkElement)
Row	Gets the row associated with this presenter. (Inherited from C1.WPF.DataGrid.DataGridRowPresenter)
RowAreaMargin	Gets or sets a **Margin** that can be applied to a **System.Windows.UIElement** inside a row presenter ensuring the element won't be scrolled even whether the row is scrollable. (Inherited from C1.WPF.DataGrid.DataGridRowPresenter)
SelectedBackground	Gets or sets the **System.Windows.Media.Brush** used to highlight the control when it is selected. (Inherited from C1.WPF.DataGrid.DataGridSelectableRowPresenter)
SnapsToDevicePixels	(Inherited from System.Windows.UIElement)
Style	(Inherited from System.Windows.FrameworkElement)
TabIndex	(Inherited from System.Windows.Controls.Control)
Tag	(Inherited from System.Windows.FrameworkElement)
Template	(Inherited from System.Windows.Controls.Control)
TemplatedParent	(Inherited from System.Windows.FrameworkElement)
ToolTip	(Inherited from System.Windows.FrameworkElement)

TouchesCaptured	(Inherited from System.Windows.UIElement)
TouchesCapturedWithin	(Inherited from System.Windows.UIElement)
TouchesDirectlyOver	(Inherited from System.Windows.UIElement)
TouchesOver	(Inherited from System.Windows.UIElement)
Triggers	(Inherited from System.Windows.FrameworkElement)
Uid	(Inherited from System.Windows.UIElement)
UseLayoutRounding	(Inherited from System.Windows.FrameworkElement)
ValidationBackground	Gets or sets the brush used to paint the background of the validation elements. (Inherited from C1.WPF.DataGrid.DataGridRowPresenter)
ValidationResults	Gets or sets a collection of ValidationResult related to the corresponding row. When the number of errors is greater than 0 the background of the row will became red. (Inherited from C1.WPF.DataGrid.DataGridRowPresenter)
ValidationState	Gets or sets the ValidationState. (Inherited from C1.WPF.DataGrid.DataGridRowPresenter)
VerticalAlignment	(Inherited from System.Windows.FrameworkElement)
VerticalContentAlignment	(Inherited from System.Windows.Controls.Control)
VerticalGridLineBrush	Gets or sets the **System.Windows.Media.Brush** used to highlight the vertical grid lines. (Inherited from C1.WPF.DataGrid.DataGridRowPresenter)
VerticalGridLineVisibility	Gets or sets the visibility of the vertical grid lines of this row, If true, the vertical grid lines are shown. (Inherited from C1.WPF.DataGrid.DataGridRowPresenter)
Visibility	(Inherited from System.Windows.UIElement)
Width	(Inherited from System.Windows.FrameworkElement)

LeadingMargin Property

Gets or sets the margin between the first column and the rows headers, this space is only visible when there are grouped columns.

Syntax

Visual Basic (Declaration)
`Public Property LeadingMargin As System.Windows.Thickness`
C#
`public System.Windows.Thickness LeadingMargin {get; set;}`

Property Value

The leading margin.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Properties Methods Events

The following tables list the members exposed by DataGridSummaryRow.

Public Constructors

	Name	Description
	DataGridSummaryRow Constructor	Initializes a new instance of the DataGridSummaryRow class.

Top

Public Properties

	Name	Description
	ActualCanUserToggleDetails	Gets or sets a value indicating whether the user can toggle details, taking in consideration properties of the containing DataGrid. (Inherited from C1.WPF.DataGrid.DataGridRow)
	ActualDetailsVisibility	Gets a value indicating whether this row is showing details, taking in consideration properties of the containing DataGrid. (Inherited from C1.WPF.DataGrid.DataGridRow)
	ActualHeight	Gets the actual height in pixels. (Inherited from C1.WPF.DataGrid.DataGridRow)
	ActualHeightWithoutDetails	Gets the actual height in pixels (without the details). (Inherited from C1.WPF.DataGrid.DataGridRow)
	CanUserResize	Gets or sets a value indicating whether this row can be resized by the user. (Inherited from C1.WPF.DataGrid.DataGridRow)
	CanUserToggleDetails	Gets or sets a value indicating whether the user can toggle details. (Inherited from C1.WPF.DataGrid.DataGridRow)
	CellStyle	Gets or sets the style applied to all the cells of this row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	DataGrid	Gets the data grid to which the row belongs. (Inherited from C1.WPF.DataGrid.DataGridRow)
	DataItem	Gets the data of the row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	DependencyObjectType	(Inherited from System.Windows.DependencyObject)
	DetailsPresenter	Gets the visual element that will be arranged at the bottom of the row. (Inherited from C1.WPF.DataGrid.DataGridRow)

	DetailsVisibility	Gets or sets a value indicating whether this row is showing details. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Dispatcher	(Inherited from System.Windows.Threading.DispatcherObject)
	Errors	Gets the collection of errors associated with this row. Add errors here if you want to display an error message in the corresponding row header. (Inherited from C1.WPF.DataGrid.DataGridRow)
	HeaderPresenter	Gets the visual element that represent the header of this row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Height	Gets or sets the height of this row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	IndentWidth	Gets the distance between the row header and the first cell of the row. This empty space is only present when there are groups in the data grid. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Index	Gets the index of the row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	IsEditable	Gets a value indicating whether this row is editable. (Inherited from C1.WPF.DataGrid.DataGridRow)
	IsEditing	Gets or sets a value indicating whether this row is editing. (Inherited from C1.WPF.DataGrid.DataGridRow)
	IsMouseOver	Gets a value indicating whether the mouse is over the row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	IsSealed	(Inherited from System.Windows.DependencyObject)
	IsSelectable	Gets or sets a value indicating whether the user is allowed to set the current cell from this row. (Inherited from

		C1.WPF.DataGrid.DataGridRow)
	IsSelected	Gets a value indicating whether this row is selected. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Level	Gets the grouping level of this row. This info will be used to indent the row if the grid data is grouped. (Inherited from C1.WPF.DataGrid.DataGridRow)
	MaxHeight	Gets or sets the maximum height (in pixels) allowed. (Inherited from C1.WPF.DataGrid.DataGridRow)
	MinHeight	Gets or sets the minimum height (in pixels) allowed. (Inherited from C1.WPF.DataGrid.DataGridRow)
	ParentCollection	Gets the collection of rows to which this row belongs. (Inherited from C1.WPF.DataGrid.DataGridRow)
	ParentGroup	Gets the parent group. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Presenter	Gets the visual element that represent this row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	RowHeaderStyle	Gets or sets the style applied to the row header presenter of this row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	RowStyle	Gets or sets the style of the row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	ShowVerticalFreezingSeparator	Gets a value indicating whether to show vertical freezing separator. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Type	Gets the type of row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	ValidationResults	Gets the collection of errors associated with this row. Add errors here if you want to display an error message in the

		corresponding row header. (Inherited from C1.WPF.DataGrid.DataGridRow)
	VerticalOffset	Gets the vertical offset in pixels. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Visibility	Gets or sets the visibility of the row. (Inherited from C1.WPF.DataGrid.DataGridRow)

Top

Public Methods

	Name	Description
	ClearValue	Overloaded. (Inherited from System.Windows.DependencyObject)
	CoerceValue	(Inherited from System.Windows.DependencyObject)
	Equals	(Inherited from System.Windows.DependencyObject)
	GetCellPresenter	(Inherited from C1.WPF.DataGrid.DataGridRow)
	GetHashCode	(Inherited from System.Windows.DependencyObject)
	GetLocalValueEnumerator	(Inherited from System.Windows.DependencyObject)
	GetValue	(Inherited from System.Windows.DependencyObject)
	InvalidateProperty	(Inherited from System.Windows.DependencyObject)
	ReadLocalValue	(Inherited from System.Windows.DependencyObject)
	Refresh	Unload every visual element which is related to the row. (Inherited from C1.WPF.DataGrid.DataGridRow)
	SetCurrentValue	(Inherited from System.Windows.DependencyObject)

	SetValue	Overloaded. (Inherited from System.Windows.DependencyObject)
	ToString	Returns a **System.String** that represents the current **System.Object**. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Validate	Overloaded. Validates the DataItem. Implement IDataErrorInfo or INotifyDataErrorInfo in order to implement your own validation rules. (Inherited from C1.WPF.DataGrid.DataGridRow)

Top

Public Events

	Name	Description
	CanUserResizeChanged	Occurs after the CanUserResize value changed. (Inherited from C1.WPF.DataGrid.DataGridRow)
	CanUserToggleDetailsChanged	Occurs after the CanUserToggleDetails value changed. (Inherited from C1.WPF.DataGrid.DataGridRow)
	DetailsVisibilityChanged	Occurs after the visibility of the details of the row changed. (Inherited from C1.WPF.DataGrid.DataGridRow)
	HeightChanged	Occurs after the height was changed. (Inherited from C1.WPF.DataGrid.DataGridRow)
	IsEditingChanged	Occurs when the IsEditing value changed. (Inherited from C1.WPF.DataGrid.DataGridRow)
	Loaded	Occurs after the row is added to the collection of rows. (Inherited from C1.WPF.DataGrid.DataGridRow)
	PropertyChanged	Occurs when a property value changes. (Inherited from C1.WPF.DataGrid.DataGridRow)
	VisibilityChanged	Occurs after the visibility of the row changed. (Inherited

		from C1.WPF.DataGrid.DataGridRow)

Overview

Classes

	Class	Description
	C1XLBook	Represents an Excel workbook containing one or more worksheets. Contains methods for loading and saving XLS files, and exposes a collection of XLSheet objects that represent the individual worksheets.

	ShapeCollection	Represents a collection of XLShape objects on an XLSheet.
	XLBorderFormatting	The border formatting.
	XLCell	Represents individual cells in an XLSheet and provides properties for getting and setting the cell Value, Style, and Hyperlink.
	XLCellRange	Represents a range of XLCell objects in an XLSheet.
	XLCellRangeCollection	Represents a collection of XLCellRange objects on an XLSheet.
	XLColumn	Represents a column in a worksheet. This class provides properties for setting the column's width, style, and visibility.
	XLColumnCollection	Represents a collection of XLColumn objects that represent the individual columns in each XLSheet.
	XLComment	Represents a comment associated with a cell.
	XLCommentCollection	Represents a collection of XLComment objects in a XLSheet.
	XLCommentShape	Represents a text shape embedded in an XLSheet.
	XLConditionalFormatting	Conditional formatting.
	XLConditionalFormattingCollection	The collection of conditional formattin ranges.
	XLConditionalFormattingRangeCollection	The collection of conditional formatting ranges.

XLConditionalFormattingRule	Conditional formatting.
XLConditionalFormattingRuleCollection	The collection of conditional formattin ranges.
XLFont	XLFont
XLFontFormatting	The font formatting.
XLNamedRange	Represents a named range of XLCell objects on one or several worksheets.
XLNamedRangeCollection	Represents a collection of XLNamedRange objects.
XLOpaqueShape	Represents a shape that was inserted in the sheet using Excel and is preserved but not fully exposed by the C1XLBook component.
XLPatternFormatting	The pattern formatting.
XLPictureShape	Represents an Image embedded in an XLSheet.
XLPrintSettings	Provides options and settings for printing XLSheet objects.
XLRange	The simple cell range.
XLRow	Represents a row in a worksheet, provides properties for setting the row's height, style, and visibility.
XLRowCollection	Represents a collection of XLRow objects that represent the individual rows in each XLSheet.
XLShape	Represents a shape embedded in an XLSheet.
XLSheet	Represents individual worksheets in an Excel workbook (C1XLBook).

XLSheetCollection	Collection of XLSheet objects that represent the individual worksheets in a C1XLBook.
XLStyle	Contains style elements used to define the appearance of the cells.
XLTextShape	Represents a common text shape embedded in an XLSheet.

Interfaces

Interface	Description
ICloneable	Supports cloning, which creates a new instance of a class with the same value as an existing instance.

Enumerations

Enumeration	Description
CalculationMode	Specifies calculation mode for all formulas in the workbook.
CompatibilityMode	Specifies limits to sheet size that correspond to specific versions of Microsoft Excel.
ConsolidationFunction	Specifies consolidation function for sheet subtotals.
FileFormat	Specifies the file format to use when loading or saving workbooks.
ImageScaling	Specifies how images are scaled within spreadsheet cells.
XLAlignHorzEnum	Specifies how to align cell content horizontally within a cell.
XLAlignVertEnum	Specifies how to align cell content vertically within a

		cell.
	XLConditionalFormattingOperator	Conditional formatting operator (applicable when cell type formating).
	XLConditionalFormattingType	Conditional formatting type.
	XLDiagonalFlags	Specifies the type of diagonal line to draw across the cells.
	XLEscapementType	Conditional formatting escapement type for the font.
	XLFontScript	The Excel font superscript/subscript style.
	XLHorizTextAlign	Specifies horizontal text alignment.
	XLLineStyleEnum	Specifies the line style used for the cell borders.
	XLPatternEnum	Specifies the pattern used to fill the cell background.
	XLPictureViewType	Specifies how images should be displayed (color, grayscale, or black and white).
	XLRangeType	The range type.
	XLReadingDirection	Specifies the reading direction (East Asian versions of MS Excel).
	XLReferenceMode	The reference mode.
	XLReferenceType	The reference type.
	XLShapeDashedLineStyleEnum	Specifies the dash style of borders drawn around XLShape objects.
	XLShapeLineStyleEnum	Specifies the style of borders drawn around XLShape objects.

	XLTextOrientation	Specifies text orientation.
	XLUnderlineStyle	The Excel font underline style.
	XLUnderlineType	Conditional formatting underline type for the font.
	XLVertTextAlign	Specifies vertical text alignment.

Overview

Represents an Excel workbook containing one or more worksheets.

Contains methods for loading and saving XLS files, and exposes a collection of XLSheet objects that represent the individual worksheets.

Object Model

Syntax

Visual Basic (Declaration)

`Public Class C1XLBook`
`  Inherits System.ComponentModel.Component`
`  Implements ICloneable`

C#
`public class C1XLBook : System.ComponentModel.Component, ICloneable`

Inheritance Hierarchy

System.Object
  System.MarshalByRefObject
    System.ComponentModel.Component
      C1.WPF.Excel.C1XLBook

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Members

Properties Methods Events

The following tables list the members exposed by C1XLBook.

Public Constructors

	Name	Description
	C1XLBook Constructor	Creates a new instance of the C1XLBook class. The new workbook contains a single empty XLSheet called "Sheet1".

Top

Public Properties

	Name	Description
	Author	Gets or sets the name of the person, company, or application that created this C1XLBook.
	CalculationMode	Gets or sets the formula calculation mode.
	CompatibilityMode	Gets or sets a value determining the limits on sheet size and the number of styles allowed per workbook.
	Container	(Inherited from System.ComponentModel.Component)
	DefaultFont	Gets or sets the default font object for the C1XLBook.
	IsLoading	Determines whether the workbook is currently loading.

	KeepFormulas	Specifies whether the component should store formulas read from XLS/XLSX files and write them back when saving the file.
	NamedRanges	Gets the collection of XLNamedRange objects for the current workbook.
	OpaqueCopy	Gets or sets a value specifying whether the component should copy non-main BIFF records as opaque when loading and saving XLS files.
	Palette	Gets or sets color palette of this workbook.
	Sheets	Gets a collection of XLSheet objects that represent the worksheets in the C1XLBook.
	Site	(Inherited from System.ComponentModel.Component)
	UseTempStorage	Specifies whether the component should use temporary storage at saving to XLSX/XSLT files for minimization used memory.

Top

Public Methods

	Name	Description
	Clear	Clears the C1XLBook, restoring the initial state with a single XLSheet called "Sheet1".
	Clone	Creates a copy of this C1Excel book.
	CreateObjRef	(Inherited from System.MarshalByRefObject)
	Dispose	(Inherited from System.ComponentModel.Component)
	GetLifetimeService	(Inherited from System.MarshalByRefObject)
	InitializeLifetimeService	(Inherited from System.MarshalByRefObject)
	Load	Overloaded. Loads an Excel worksheet from a file.

S	PixelsToTwips	Converts a pixel measurement into twips (1/20th of a point).
	Save	Overloaded. Saves the worksheet to a file.
	ToString	(Inherited from System.ComponentModel.Component)
S	TwipsToPixels	Converts a twip measurement into screen pixels.

Clear Method

Clears the C1XLBook, restoring the initial state with a single XLSheet called "Sheet1".

Syntax

Visual Basic (Declaration)
`Public Sub Clear()`
C#
`public void Clear()`

Remarks

The Clear method restores the C1XLBook object to its initial state, with a single empty sheet called "Sheet1" and the DefaultFont set to 10pt Arial.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Clone Method

Creates a copy of this C1Excel book.

Syntax

Visual Basic (Declaration)
`Public Function Clone() As C1XLBook`

C#

```
public C1XLBook Clone()
```

Return Value

A new C1XLBook object with the same contents and formatting as this book.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Load Method
Loads an Excel worksheet from a file.

Overload List

Overload	Description
Load(String)	Loads an Excel worksheet from a file.
Load(String,Boolean)	Loads an Excel worksheet from a file.
Load(String,FileFormat)	Loads an Excel worksheet from a file.
Load(String,FileFormat,Boolean)	Loads an Excel worksheet from a file.
Load(Stream)	Loads the worksheet from a stream.
Load(Stream,Boolean)	Loads the worksheet from a stream.
Load(Stream,FileFormat)	Loads the worksheet from a stream.
Load(Stream,FileFormat,Boolean)	Loads the worksheet from a stream.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

C1XLBook Class
C1XLBook Members

Load(String) Method
Name of the file that contains the worksheet.

Loads an Excel worksheet from a file.

Syntax

Visual Basic (Declaration)

```
Public Overloads Sub Load( _
   ByVal fileName As System.String _
)
```

C#

```
public void Load(
   System.string fileName
)
```

Parameters

fileName

Name of the file that contains the worksheet.

Remarks

Component One Excel infers the file format automatically based on the file name extension. "XLSX" and "ZIP" files are loaded as OpenXml; all others are loaded as Biff8 files ("xls").

If the file doesn't exist, is locked, or is not a valid Excel file, an exception is thrown.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Overload List

Load(String,Boolean) Method
Name of the file that contains the worksheet.

True to load data into the sheets; False to read the sheet names only.

Loads an Excel worksheet from a file.

Syntax

Visual Basic (Declaration)

```
Public Overloads Sub Load( _
   ByVal fileName As System.String, _
   ByVal fillSheets As System.Boolean _
)
```

C#

```
public void Load(
   System.string fileName,
   System.bool fillSheets
)
```

Parameters

fileName

Name of the file that contains the worksheet.

fillSheets

True to load data into the sheets; False to read the sheet names only.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Loads an Excel worksheet from a file.

Syntax

Visual Basic (Declaration)

```
Public Overloads Sub Load( _
   ByVal fileName As System.String, _
   ByVal format As FileFormat, _
   ByVal fillSheets As System.Boolean _
)
```

C#

```
public void Load(
   System.string fileName,
   FileFormat format,
   System.bool fillSheets
)
```

Parameters

fileName

Name of the file that contains the worksheet.

format

FileFormat value that specifies the file format.

fillSheets

True to load data into the sheets; False to read the sheet names only.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Load(Stream,Boolean) Method
System.IO.Stream that contains the worksheet.

True to load data into the sheets; False to read the sheet names only.

Loads the worksheet from a stream.

Syntax

Visual Basic (Declaration)

```
Public Overloads Sub Load( _
   ByVal stream As System.IO.Stream, _
   ByVal fillSheets As System.Boolean _
)
```

C#

```
public void Load(
   System.IO.Stream stream,
   System.bool fillSheets
)
```

Parameters

stream

System.IO.Stream that contains the worksheet.

fillSheets

True to load data into the sheets; False to read the sheet names only.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

C1XLBook Class
C1XLBook Members
Overload List

Load(Stream,FileFormat) Method
System.IO.Stream that contains the worksheet.

FileFormat value that specifies the file format.

Loads the worksheet from a stream.

Syntax

Visual Basic (Declaration)

```
Public Overloads Sub Load( _
   ByVal stream As System.IO.Stream, _
   ByVal format As FileFormat _
)
```

C#

```
public void Load(
   System.IO.Stream stream,
   FileFormat format
)
```

Parameters

stream

System.IO.Stream that contains the worksheet.

format

FileFormat value that specifies the file format.

Remarks

Loading the worksheets without their data is much faster than loading the entire workbook. This is useful in situations where you want to examine the contents of the file (for example, to ensure that you will not overwrite an existing sheet).

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Overload List

Load(Stream,FileFormat,Boolean) Method
System.IO.Stream that contains the worksheet.

FileFormat value that specifies the file format.

True to load data into the sheets; **False** to read the sheet names only.

Loads the worksheet from a stream.

Syntax

Visual Basic (Declaration)

```
Public Overloads Sub Load( _
   ByVal stream As System.IO.Stream, _
   ByVal format As FileFormat, _
   ByVal fillSheets As System.Boolean _
)
```

C#

```
public void Load(
   System.IO.Stream stream,
   FileFormat format,
   System.bool fillSheets
)
```

Parameters

stream

System.IO.Stream that contains the worksheet.

format

FileFormat value that specifies the file format.

fillSheets

True to load data into the sheets; **False** to read the sheet names only.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Overload List

PixelsToTwips Method

Measurement in screen pixels.

Converts a pixel measurement into twips (1/20th of a point).

Syntax

Visual Basic (Declaration)

```
Public Shared Function PixelsToTwips( _
   ByVal pix As System.Double _
) As System.Integer
```

C#

```
public static System.int PixelsToTwips(
   System.double pix
)
```

Parameters

pix

Measurement in screen pixels.

Return Value

Measurement in twips.

Remarks

Excel stores measurements in twips (1/20th of a point), a resolution-independent unit. .NET controls, on the other hand, usually express measurements in pixels. This method provides an easy way to convert pixel measurements into twips using the current screen resolution.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

TwipsToPixels Method

Save Method

Saves the worksheet to a file.

Overload List

Overload	Description
Save(String)	Saves the worksheet to a file.
Save(String,FileFormat)	Saves the worksheet to a file.
Save(Stream)	Saves the worksheet into a stream.
Save(Stream,FileFormat)	Saves the worksheet into a stream.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

Save(String) Method
Name of the file to save.

Saves the worksheet to a file.

Syntax

Visual Basic (Declaration)

```
Public Overloads Sub Save( _
   ByVal fileName As System.String _
)
```

C#

```
public void Save(
   System.string fileName
)
```

Parameters

fileName

Name of the file to save.

Remarks

The format used to save the file is automatically determined by the file name extension. "Xlsx" and "zip" files are saved as OpenXml; all others are saved as Biff8 files ("xls").

If the file can't be created, an exception is thrown. This typically indicates that the file is currently open by another application (such as Microsoft Excel).

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

Save(String,FileFormat) Method
Name of the file to save.

FileFormat value that specifies the type of file to save.

Saves the worksheet to a file.

Syntax

Visual Basic (Declaration)

```
Public Overloads Sub Save( _
   ByVal fileName As System.String, _
   ByVal format As FileFormat _
)
```

C#

```
public void Save(
   System.string fileName,
   FileFormat format
)
```

Parameters

fileName

Name of the file to save.

format

FileFormat value that specifies the type of file to save.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

Save(Stream) Method

Example

System.IO.Stream where the worksheet is saved.

Saves the worksheet into a stream.

Syntax

Visual Basic (Declaration)

```
Public Overloads Sub Save( _
   ByVal stream As System.IO.Stream _
)
```

C#

```
public void Save(
   System.IO.Stream stream
)
```

Parameters

stream

System.IO.Stream where the worksheet is saved.

Remarks

This method allows saving the workbook directly into streams without using temporary files. Typical uses include saving books to web page response streams or mail attachment streams.

Example

The code below saves a C1XLBook into a **System.IO.MemoryStream**, clears the book, then loads it back from the same stream.

- C#

```
// save book into new MemoryStream
MemoryStream ms = new MemoryStream();
_book.Save(ms);

// clear book
_book.Clear();
```

```
// load it back from the MemoryStream
ms.Position = 0;
_book.Load(ms);
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Overload List

Save(Stream,FileFormat) Method
System.IO.Stream where the worksheet is saved.

FileFormat value that specifies the format to save the worksheet in.

Saves the worksheet into a stream.

Syntax

Visual Basic (Declaration)

```
Public Overloads Sub Save( _
   ByVal stream As System.IO.Stream, _
   ByVal format As FileFormat _
)
```

C#

```
public void Save(
   System.IO.Stream stream,
   FileFormat format
)
```

Parameters

stream

System.IO.Stream where the worksheet is saved.

format

FileFormat value that specifies the format to save the worksheet in.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

TwipsToPixels Method

Measurement in twips.

Converts a twip measurement into screen pixels.

Syntax

Visual Basic (Declaration)

```
Public Shared Function TwipsToPixels( _
   ByVal twip As System.Double _
) As System.Integer
```

C#

```
public static System.int TwipsToPixels(
   System.double twip
)
```

Parameters

twip

Measurement in twips.

Return Value

Measurement in screen pixels.

Remarks

Excel stores measurements in twips (1/20th of a point), a resolution-independent unit. .NET controls, on the other hand, usually express measurements in pixels. This method provides an easy way to convert pixel measurements into twips using the current screen resolution.

PixelsToTwips

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Author Property

Gets or sets the name of the person, company, or application that created this C1XLBook.

Syntax

Visual Basic (Declaration)

```
Public Property Author As System.String
```

C#

```
public System.string Author {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

CalculationMode Property

Gets or sets the formula calculation mode.

Syntax

Visual Basic (Declaration)

```
Public Property CalculationMode As CalculationMode
```

C#

```
public CalculationMode CalculationMode {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

C1XLBook Class
C1XLBook Members

CompatibilityMode Property

Gets or sets a value determining the limits on sheet size and the number of styles allowed per workbook.

Syntax

Visual Basic (Declaration)

```
Public Property CompatibilityMode As CompatibilityMode
```

C#

```
public CompatibilityMode CompatibilityMode {get; set;}
```

Remarks

This property allows you to specify which version of Microsoft Excel you want your workbooks to be compatible with.

Excel2003 mode allows you to create sheets with up to 65,536 rows and 256 columns.
Excel2007 mode allows you to create sheets with up to 1,048,576 rows and 18,278 columns.

Note that the XLS file format is limited by the **Excel2003** limits. If you use the **Excel2007** mode and create large sheets, save them into **OpenXml** files instead of XLS.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

C1XLBook Class
C1XLBook Members

DefaultFont Property
Gets or sets the default font object for the C1XLBook.

Syntax

Visual Basic (Declaration)

```
Public Property DefaultFont As XLFont
```

C#

```
public XLFont DefaultFont {get; set;}
```

Remarks

You can assign any font to any cell using XLStyle objects. Cells that have no associated custom styles or have styles that do not define a custom font are displayed using the book's default font.

The DefaultFont property is initially set to 10 pt Arial.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

C1XLBook Members

IsLoading Property

Determines whether the workbook is currently loading.

Syntax

Visual Basic (Declaration)
`Public ReadOnly Property IsLoading As System.Boolean`
C#
`public System.bool IsLoading {get;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

C1XLBook Class
C1XLBook Members

KeepFormulas Property

Specifies whether the component should store formulas read from XLS/XLSX files and write them back when saving the file.

Syntax

Visual Basic (Declaration)

```
Public Property KeepFormulas As System.Boolean
```

C#

```
public System.bool KeepFormulas {get; set;}
```

Remarks

Setting this property to true allows you to load existing XLS/XLSX files, modify the values in some cells, and save the file preserving the formulas. This is the default setting.

Setting this property to false causes the component to remove the formulas in the book when it is loaded. Saving the file in this case will retain the last calculated values but will remove the formulas.

Assigning any value to a cell will clear the formula in the cell.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

NamedRanges Property
Gets the collection of XLNamedRange objects for the current workbook.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property NamedRanges As XLNamedRangeCollection
```

C#

```
public XLNamedRangeCollection NamedRanges {get;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

OpaqueCopy Property

Gets or sets a value specifying whether the component should copy non-main BIFF records as opaque when loading and saving XLS files.

Syntax

Visual Basic (Declaration)
`Public Property OpaqueCopy As System.Boolean`
C#
`public System.bool OpaqueCopy {get; set;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Palette Property

Gets or sets color palette of this workbook.

Syntax

Visual Basic (Declaration)
`Public Property Palette As System.Windows.Media.Color()`

C#

```
public System.Windows.Media.Color[] Palette {get; set;}
```

Remarks

The palette must be more 8 items (first 8 colors is standard pallete: Black, White, Red, Green, Blue, Yellow, Magenta, Cyan).

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Sheets Property
Gets a collection of XLSheet objects that represent the worksheets in the C1XLBook.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property Sheets As XLSheetCollection
```

C#

```
public XLSheetCollection Sheets {get;}
```

Remarks

The XLSheetCollection returned has methods for counting, enumerating, adding and removing sheets from the C1XLBook.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

UseTempStorage Property

Specifies whether the component should use temporary storage at saving to XLSX/XSLT files for minimization used memory.

Syntax

Visual Basic (Declaration)

```
Public Property UseTempStorage As System.Boolean
```

C#

```
public System.bool UseTempStorage {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Add Method

XLShape object to add to the collection.

Appends an XLShape object to the collection.

Syntax

Visual Basic (Declaration)	

```
Public Function Add( _
   ByVal shape As XLShape _
) As XLShape
```

C#

```
public XLShape Add(
   XLShape shape
)
```

Parameters

shape

XLShape object to add to the collection.

Return Value

A reference to the object if it was successfully added to the collection, or null if the object could not be added to the collection (usually because it overlaps another cell range already in the collection).

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Contains(XLShape) Method
XLShape object to look for.

Checks whether the collection contains a specific XLShape object.

Syntax

Visual Basic (Declaration)

```
Public Overloads Function Contains( _
   ByVal shape As XLShape _
) As System.Boolean
```

C#

```
public System.bool Contains(
   XLShape shape
)
```

Parameters

shape

XLShape object to look for.

Return Value

True if the collection contains the range, False otherwise.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Overload List

Contains(Int32) Method
The identifier of the object to look for.

Checks whether the collection contains a specific XLShape object.

Syntax

Visual Basic (Declaration)

```
Public Overloads Function Contains( _
   ByVal id As System.Integer _
) As System.Boolean
```

C#

```
public System.bool Contains(
   System.int id
)
```

Parameters

id

The identifier of the object to look for.

Return Value

True if the collection contains the range, False otherwise.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IndexOf(XLShape) Method
XLShape object to look for.

Gets the position of an XLShape object in the collection.

Syntax

Visual Basic (Declaration)

```
Public Overloads Function IndexOf( _
   ByVal shape As XLShape _
) As System.Integer
```

C#

```
public System.int IndexOf(
   XLShape shape
)
```

Parameters

shape

XLShape object to look for.

Return Value

The position of the object in the collection, or -1 if the object is not a member of the collection.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Insert Method

Position where the object will be inserted.

Object to insert in the collection.

Inserts an XLShape object at a specific position in the collection.

Syntax

Visual Basic (Declaration)

```
Public Overridable Function Insert( _
   ByVal index As System.Integer, _
   ByVal shape As XLShape _
) As XLShape
```

C#

```
public virtual XLShape Insert(
   System.int index,
   XLShape shape
)
```

Parameters

index

Position where the object will be inserted.

shape

Object to insert in the collection.

Return Value

A reference to the object if it was successfully added to the collection, or null if the object could not be added to the collection (usually because it overlaps another cell range already in the collection).

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

XLCell

Example

Represents individual cells in an XLSheet and provides properties for getting and setting the cell Value, Style, and Hyperlink.

Object Model

Syntax

Visual Basic (Declaration)

```
Public Class XLCell
   Implements ICloneable
```

C#

```
public class XLCell : ICloneable
```

Remarks

To create cells, use the XLSheet indexer (Item property). If the cell already exists, the reference will be returned as usual. If not, the sheet will create the cell (as well as rows and columns if necessary) and will return a reference to the new cell.

Because it creates cells automatically, the indexer is especially useful when creating and populating sheets.

Example

For example, the code below creates a new C1XLBook, then populates the first sheet with a 10 by 10 multiplication table: Note how the code simply accesses the cells using the indexer. There's no need to create any rows, columns, or cells. The indexer takes care of all that automatically.

- C#

```
C1XLBook book = new C1XLBook();
XLSheet sheet = book.Sheets[0];
for (int r = 0; r < 10; r++)
{
  for (int c = 0; c < 10; c++)
  {
    XLCell cell = sheet[r, c];
       cell.Value = (r+1) * (c+1);
  }
}
book.Save(@"c:\temp\test.xls");
```

Inheritance Hierarchy

XLCell Members

SetValue Method
New cell value.

New cell style.

Sets the Value and Style properties of a cell.

Syntax

Visual Basic (Declaration)

```
Public Sub SetValue( _
   ByVal value As System.Object, _
   ByVal style As XLStyle _
)
```

C#

```
public void SetValue(
   System.object value,
   XLStyle style
)
```

Parameters

value

New cell value.

style

New cell style.

Remarks

This method allows you to set the Value and Style properties of a cell simultaneously. This can make your code more compact and easier to maintain. For example:

```
// set cell value and style (short version)
sheet[0,0].SetValue("Hello", styleBold); // set cell value and style (longer version)
sheet[0,0].Value = "Hello";
sheet[0,0].Style = styleBold;
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Properties

%%scrap%%

" -->

For a list of all members of this type, see XLCell members.

Public Properties

	Name	Description
	Formula	Gets or sets a string that specifies a formula of the cell.
	Hyperlink	Gets or sets a string that specifies an action to take when the cell is clicked.
	Style	Gets or sets the XLStyle object associated with the cell.
	Text	Gets the string representation of the current cell value.
	Value	Gets or sets the value stored in the cell.

Top

XLCell Class
C1.WPF.Excel Namespace

Formula Property

Gets or sets a string that specifies a formula of the cell.

Syntax

Visual Basic (Declaration)
`Public Property Formula As System.String`
C#
`public System.string Formula {get; set;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLCell Class
XLCell Members

Hyperlink Property

Gets or sets a string that specifies an action to take when the cell is clicked.

Syntax

Visual Basic (Declaration)
`Public Property Hyperlink As System.String`
C#
`public System.string Hyperlink {get; set;}`

Remarks

Hyperlinks may contain URLs that when clicked open a browser window and navigate to the specified site (for example, "http://www.componentone.com"). They may also contain references to files that are launched by the application associated with the file type (for example, "readme.doc"). Finally, hyperlinks can be used to send e-mails (for example, "mailto:joe@foo.com").

Each cell may contain a hyperlink and a value. However, if you assign a hyperlink to a cell that has no value (Value == null), then the hyperlink text is automatically assigned to the cell value as well.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLCell Class
XLCell Members

Style Property

Gets or sets the XLStyle object associated with the cell.

Syntax

Visual Basic (Declaration)
`Public Property Style As XLStyle`
C#
`public XLStyle Style {get; set;}`

Remarks

The appearance of each cell is defined by one or more XLStyle objects.

When displaying a cell, Excel combines the row, column, and cell styles and merges the style elements defined in each one in order to determine how the cell should be displayed.

The precedence of the styles is: (1) cell, (2) row, (3) column, (4) default style. For example, if a cell style defines the font and background color, those will be applied regardless of the settings in the row and column styles. If the row style defines an alignment, that will be applied regardless of the column style, and so on.

The cell style may be null, in which case the cell is displayed using the other styles available or the default book style if no others are available.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Text Property

Gets the string representation of the current cell value.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property Text As System.String
```

C#

```
public System.string Text {get;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLCell Class
XLCell Members

Value Property

Gets or sets the value stored in the cell.

Syntax

Visual Basic (Declaration)

```
Public Property Value As System.Object
```

C#

```
public System.object Value {get; set;}
```

Remarks

The value may contain strings, numeric, Boolean, DateTime, or null objects. Other types of objects cannot be saved in Excel files.

DateTime values are internally converted into doubles, and stored in the sheet as such. The only way to tell the difference between a DateTime value and a double in Excel is by way of the format associated with the cell (XLStyle.Format property).

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Properties Methods

The following tables list the members exposed by XLCellRange.

Public Constructors

	Name	Description
	XLCellRange Constructor	Overloaded.

Top

Public Properties

	Name	Description
	Book	Gets a reference to the parent C1XLBook object.
	ColumnCount	Gets the number of columns in the range.
	ColumnFrom	Gets the index of the left column in the range.
	ColumnFromRef	Gets the reference type of the left column in the range.
	ColumnTo	Gets or sets the index of the last column in the range.
	ColumnToRef	Gets the reference type of the right column in the range.
	IsEmpty	Determines whether the range is empty.

	RangeType	Gets or sets a type (default, indirect or offset) for this cell range.
	RowCount	Gets the number of rows in the range.
	RowFrom	Gets the index of the top row in the range.
	RowFromRef	Gets the reference type of the top row in the range.
	RowTo	Gets or sets the index of the last row in the range.
	RowToRef	Gets the reference type of the bottom row in the range.
	SheetCount	Gets the number of sheets in the range.
	SheetFrom	Gets the index of the first sheet in the range.
	Sheets	Gets an array of XLSheet objects.
	SheetTo	Gets or sets the index of the last sheet in the range.
	Style	Gets or sets the XLStyle object associated with this range of cells.
	Value	Gets or sets the complex value associated with this range of cells.

Top

Public Methods

	Name	Description
	Clone	Creates a copy of this cell range.
	Contains	Overloaded. Determines whether the range contains a specific cell.
	Intersects	Determines whether the range intersects another range.
	ToString	Returns a reference string that represents the range.

Overload List

Overload	Description
XLCellRange Constructor()	Creates an instance of an XLCellRange object containing an empty range.
XLCellRange Constructor(Int32,Int32,Int32,Int32)	Creates an instance of an XLCellRange object containing a specified range.

XLCellRange Constructor(XLSheet,Int32,Int32,Int32,Int32)	Creates an instance of an XLCellRange object containing a specified range.
XLCellRange Constructor(XLSheet,Int32,Int32,Int32,Int32,XLReferenceType,XLReferenceType,XLReferenceType,XLReferenceType)	Creates an instance of an XLCellRange object containing a specified range.
XLCellRange Constructor(XLSheet,Int32,Int32,XLReferenceType,XLReferenceType)	Creates an instance of an XLCellRange object containing a specified range.

XLCellRange Constructor(Int32,Int32,Int32,Int32,Int32,Int32,XLReferenceType,XLReferenceType,XLReferenceType,XLReferenceType)	Creates an instance of an XLCellRange object containing a specified range.
XLCellRange Constructor(XLSheet,String)	Creates an instance of an XLCellRange object containing a specified range.
XLCellRange Constructor(C1XLBook,String)	Creates an instance of an XLCellRange object containing a

	specified range.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

   XLReferenceType colFromRef,
   XLReferenceType colToRef
)
```

Parameters

sheet

The XLSheet of this cell range.

rowFrom

Top row in the range.

rowTo

Bottom row in the range.

colFrom

Left column in the range.

colTo

Right column in the range.

rowFromRef

The reference type of the top row in the range.

rowToRef

The reference type of the bottom row in the range.

colFromRef

The reference type of the left column in the range.

colToRef

The reference type of the right column in the range.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ColumnFromRef Property
Gets the reference type of the left column in the range.

Syntax

Visual Basic (Declaration)
`Public ReadOnly Property ColumnFromRef As XLReferenceType`
C#
`public XLReferenceType ColumnFromRef {get;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

ColumnTo Property

Gets or sets the index of the last column in the range.

Syntax

Visual Basic (Declaration)
`Public Property ColumnTo As System.Integer`
C#
`public System.int ColumnTo {get; set;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

ColumnToRef Property

Gets the reference type of the right column in the range.

Syntax

Visual Basic (Declaration)
`Public ReadOnly Property ColumnToRef As XLReferenceType`
C#
`public XLReferenceType ColumnToRef {get;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

IsEmpty Property
Determines whether the range is empty.

Syntax

Visual Basic (Declaration)
`Public ReadOnly Property IsEmpty As System.Boolean`
C#
`public System.bool IsEmpty {get;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

RangeType Property
Gets or sets a type (default, indirect or offset) for this cell range.

Syntax

Visual Basic (Declaration)
`Public Property RangeType As XLRangeType`
C#
`public XLRangeType RangeType {get; set;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Value Property

Gets or sets the complex value associated with this range of cells.

Syntax

Visual Basic (Declaration)
`Public Property Value As System.Object`

C#

```
public System.object Value {get; set;}
```

Remarks

The value may contain strings, numeric, Boolean, DateTime, or null objects. Other types of objects cannot be saved in Excel files.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Members

Properties Methods

The following tables list the members exposed by XLCellRangeCollection.

Public Properties

	Name	Description
	ActiveIndex	Gets or sets the active index in the collection.
	Book	Gets a reference to the parent C1XLBook object.
	Count	Gets the number of XLCellRange objects in the collection.
	Item	Gets the XLCellRange object at the specified position in the collection.
	Sheet	Gets the XLSheet object that owns the collection.

Top

Public Methods

	Name	Description
	Add	Overloaded. Appends an XLCellRange object to the collection.
	Clear	Removes all XLCellRange objects from the collection.
	Contains	Checks whether the collection contains a specific XLCellRange object.
	IndexOf	Gets the position of an XLCellRange object in the collection.
	Insert	Inserts an XLCellRange object at a specific position in the collection.
	Remove	Removes an XLCellRange object from the collection.
	RemoveAt	Removes an XLCellRange object at a specific position from the collection.

Add Method

Appends an XLCellRange object to the collection.

Overload List

Overload	Description
Add(XLCellRange)	Appends an XLCellRange object to the collection.
Add(Int32,Int32,Int32,Int32)	Creates an XLCellRange object and appends it to the collection.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

XLCellRangeCollection Class
XLCellRangeCollection Members

Add(XLCellRange) Method
XLCellRange object to add to the collection.

Appends an XLCellRange object to the collection.

Syntax

Visual Basic (Declaration)

```
Public Overloads Function Add( _
   ByVal cr As XLCellRange _
) As XLCellRange
```

C#

```
public XLCellRange Add(
   XLCellRange cr
)
```

Parameters

cr

XLCellRange object to add to the collection.

Return Value

A reference to the object if it was successfully added to the collection, or null if the object could not be added to the collection (usually because it overlaps another cell range already in the collection).

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Overload List

Add(Int32,Int32,Int32,Int32) Method
Index of the top row in the cell range.

Index of the left column in the cell range.

Number of rows in the cell range.

Number of columns in the cell range.

Creates an XLCellRange object and appends it to the collection.

Syntax

Visual Basic (Declaration)

```
Public Overloads Function Add( _
   ByVal rowIndex As System.Integer, _
   ByVal colIndex As System.Integer, _
   ByVal rowCount As System.Integer, _
   ByVal colCount As System.Integer _
) As XLCellRange
```

C#

```
public XLCellRange Add(
   System.int rowIndex,
   System.int colIndex,
   System.int rowCount,
   System.int colCount
```

)

Parameters

rowIndex

Index of the top row in the cell range.

colIndex

Index of the left column in the cell range.

rowCount

Number of rows in the cell range.

colCount

Number of columns in the cell range.

Return Value

A reference to the object if it was successfully added to the collection, or null if the object could not be added to the collection (usually because it overlaps another cell range already in the collection).

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Overload List

Clear Method

Removes all XLCellRange objects from the collection.

Syntax

Visual Basic (Declaration)	
`Public Sub Clear()`	

C#

```
public void Clear()
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Contains Method

XLCellRange object to look for.

Checks whether the collection contains a specific XLCellRange object.

Syntax

Visual Basic (Declaration)

```
Public Function Contains( _
   ByVal cr As XLCellRange _
) As System.Boolean
```

C#

```
public System.bool Contains(
   XLCellRange cr
)
```

Parameters

cr

XLCellRange object to look for.

Return Value

True if the collection contains the range, False otherwise.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLCellRangeCollection Class

IndexOf Method

XLCellRange object to look for.

Gets the position of an XLCellRange object in the collection.

Syntax

Visual Basic (Declaration)

`Public Function IndexOf( _`
`   ByVal cr As XLCellRange _`
`) As System.Integer`

C#

`public System.int IndexOf(`
`   XLCellRange cr`
`)`

Parameters

cr

XLCellRange object to look for.

Return Value

The position of the object in the collection, or -1 if the object is not a member of the collection.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLCellRangeCollection Class
XLCellRangeCollection Members

Insert Method

Position where the object will be inserted.

Object to insert in the collection.

Inserts an XLCellRange object at a specific position in the collection.

Syntax

Visual Basic (Declaration)

```
Public Function Insert( _
   ByVal index As System.Integer, _
   ByVal cr As XLCellRange _
) As XLCellRange
```

C#

```
public XLCellRange Insert(
   System.int index,
   XLCellRange cr
)
```

Parameters

index

Position where the object will be inserted.

cr

Object to insert in the collection.

Return Value

A reference to the object if it was successfully added to the collection, or null if the object could not be added to the collection (usually because it overlaps another cell range already in the collection).

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Remove Method

XLCellRange object to remove from the collection.

Removes an XLCellRange object from the collection.

Syntax

Visual Basic (Declaration)

```
Public Sub Remove( _
   ByVal cr As XLCellRange _
)
```

C#

```
public void Remove(
   XLCellRange cr
)
```

Parameters

cr

XLCellRange object to remove from the collection.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

RemoveAt Method

Index of the object to remove from the collection.

Removes an XLCellRange object at a specific position from the collection.

Syntax

Visual Basic (Declaration)

```
Public Sub RemoveAt( _
   ByVal index As System.Integer _
)
```

C#

```
public void RemoveAt(
   System.int index
)
```

Parameters

index

Index of the object to remove from the collection.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

XLColumn

Represents a column in a worksheet. This class provides properties for setting the column's width, style, and visibility.

Object Model

Syntax

Visual Basic (Declaration)

```
Public Class XLColumn
   Implements ICloneable
```

C#

```
public class XLColumn : ICloneable
```

Remarks

The XLColumn objects do not contain any data. If you remove a column from the collection, the data will be lost. If you later re-insert that same column back into the collection, the column will be blank.

XLColumn Members

Collapsed Property

Gets or sets collapsed flag for the column.

Syntax

Visual Basic (Declaration)
`Public Property Collapsed As System.Boolean`
C#
`public System.bool Collapsed {get; set;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

IsSubtotal Property

Gets whether the column is subtotal.

Syntax

Visual Basic (Declaration)
`Public ReadOnly Property IsSubtotal As System.Boolean`
C#
`public System.bool IsSubtotal {get;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

OutlineLevel Property

Gets or sets subtotal outline level for the column.

Syntax

Visual Basic (Declaration)
`Public Property OutlineLevel As System.Integer`
C#
`public System.int OutlineLevel {get; set;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

XLColumn Members

PageBreak Property

Gets or sets whether there will be a forced page break after this column.

Syntax

Visual Basic (Declaration)
`Public Property PageBreak As System.Boolean`
C#
`public System.bool PageBreak {get; set;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

XLColumn Members

Sheet Property

Gets a reference to the parent XLSheet object.

Syntax

Visual Basic (Declaration)
`Public ReadOnly Property Sheet As XLSheet`
C#
`public XLSheet Sheet {get;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLColumn Class
XLColumn Members

Style Property

Gets or sets the XLStyle object that determines the appearance of the column.

Syntax

Visual Basic (Declaration)
`Public Property Style As XLStyle`

C#

```
public XLStyle Style {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Visible Property

Gets or sets whether the column is visible.

Syntax

Visual Basic (Declaration)

```
Public Property Visible As System.Boolean
```

C#

```
public System.bool Visible {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLColumn Class
XLColumn Members

Width Property

Gets or sets the width of the column, in twips.

Syntax

Visual Basic (Declaration)

```
Public Property Width As System.Integer
```

C#

```
public System.int Width {get; set;}
```

Remarks

A value of -1 indicates that the column should be displayed using the sheet's XLSheet.DefaultColumnWidth.

To convert between pixels and twips, use the C1XLBook.TwipsToPixels and PixelsToTwips methods.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

XLColumnCollection

Example

Represents a collection of XLColumn objects that represent the individual columns in each XLSheet.

Object Model

Syntax

Visual Basic (Declaration)

```
Public Class XLColumnCollection
```

C#

```
public class XLColumnCollection
```

Remarks

The collection has methods for counting, enumerating, adding, and removing columns from the collection.

The XLColumn objects do not contain any data. If you remove a column from the collection, the data will be lost. If you later re-insert that same column back into the collection, the column will be blank.

Example

Note that you can create columns automatically by using the sheet's indexer. For example, the following code retrieves the cell at coordinates (3,3) and in doing so automatically creates four rows and four columns automatically:

- C#

```
C1XLBook book  = new C1XLBook();
XLSheet  sheet = book.Sheets[0];
XLCell   cell  = sheet[3,3]; // creates 4 rows and 4 columns
```

Inheritance Hierarchy

System.Object
  C1.WPF.Excel.XLColumnCollection

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Properties Methods

The following tables list the members exposed by XLColumnCollection.

Public Properties

	Name	Description
	Book	Gets a reference to the parent C1XLBook object.
	Count	Gets the number of items in the collection.
	Frozen	Gets or sets the number of frozen columns in the collection.
	Item	Returns a reference to the XLColumn object at the specified index.
	Sheet	Gets a reference to the parent XLSheet object.

Top

Public Methods

	Name	Description
	Add	Overloaded. Creates a new XLColumn object and adds it to the collection.
	Clear	Removes all items from the collection.
	Contains	Determines whether an XLColumn is a member of the collection.
	IndexOf	Gets the index of a given XLRow object in the collection.
	Insert	Overloaded. Creates a new XLColumn object and inserts it at a specific position in the collection.
	Remove	Removes an XLColumn object from the collection.

	RemoveAt	Removes the XLColumn object at a given position from the collection.

Add Method

Creates a new XLColumn object and adds it to the collection.

Overload List

Overload	Description
Add()	Creates a new XLColumn object and adds it to the collection.
Add(XLColumn)	Adds an XLColumn object to the collection.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Add() Method
Creates a new XLColumn object and adds it to the collection.

Syntax

Visual Basic (Declaration)

```
Public Overloads Function Add() As XLColumn
```

C#

```
public XLColumn Add()
```

Return Value

A reference to the new XLColumn object.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLColumnCollection Class
XLColumnCollection Members
Overload List

Add(XLColumn) Method
The item to add to the collection.

Adds an XLColumn object to the collection.

Syntax

Visual Basic (Declaration)

`Public Overloads Function Add( _`
`   ByVal col As XLColumn _`
`) As XLColumn`

C#

`public XLColumn Add(`
`   XLColumn col`
`)`

Parameters

col

The item to add to the collection.

Return Value

A reference to the item that was added to the collection (in this case, always the col parameter).

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLColumnCollection Class
XLColumnCollection Members
Overload List

Clear Method

Removes all items from the collection.

Syntax

Visual Basic (Declaration)
`Public Sub Clear()`
C#
`public void Clear()`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Contains Method

Item to look for.

Determines whether an XLColumn is a member of the collection.

Syntax

Visual Basic (Declaration)

`Public Function Contains( _`
`  ByVal col As XLColumn _`
`) As System.Boolean`

C#

`public System.bool Contains(`
`  XLColumn col`
`)`

Parameters

col

Item to look for.

Return Value

True if the collection contains the item, False otherwise.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLColumnCollection Class
XLColumnCollection Members

IndexOf Method
Item to look for.

Gets the index of a given XLRow object in the collection.

Syntax

Visual Basic (Declaration)

`Public Function IndexOf( _`
`   ByVal col As XLColumn _`
`) As System.Integer`

C#

`public System.int IndexOf(`
`   XLColumn col`
`)`

Parameters

col

Item to look for.

Return Value

The position of the item in the collection, or -1 if the item is not a member of the collection.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLColumnCollection Members

Insert Method
Creates a new XLColumn object and inserts it at a specific position in the collection.

Overload List

Overload	Description
Insert(Int32)	Creates a new XLColumn object and inserts it at a specific position in the collection.
Insert(Int32,XLColumn)	Inserts an XLColumn object at a specific position in the collection.
Insert(Int32,XLColumn,XLCell[])	Inserts an XLColumn object at a specific position in the collection.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLColumnCollection Class
XLColumnCollection Members

Insert(Int32) Method
Position where the new item will be inserted.

Creates a new XLColumn object and inserts it at a specific position in the collection.

Syntax

Visual Basic (Declaration)

`Public Overloads Function Insert( _`
`   ByVal index As System.Integer _`
`) As XLColumn`

C#

`public XLColumn Insert(`
`   System.int index`
`)`

Parameters

index

Position where the new item will be inserted.

Return Value

A reference to the new item.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLColumnCollection Class
XLColumnCollection Members
Overload List

Insert(Int32,XLColumn) Method
Position where the item will be inserted.

Item that will be inserted.

Inserts an XLColumn object at a specific position in the collection.

Syntax

Visual Basic (Declaration)

```
Public Overloads Function Insert( _
   ByVal index As System.Integer, _
   ByVal col As XLColumn _
) As XLColumn
```

C#

```
public XLColumn Insert(
   System.int index,
   XLColumn col
)
```

Parameters

index

Position where the item will be inserted.

col

Item that will be inserted.

Return Value

A reference to the item that was added to the collection.

Remarks

The maximum number of XLColumn objects in an XLSheet is 256. This is a limitation imposed by Excel 2003 and below.

For Excel 2007 and above, the maximum number of XLColumn objects in an XLSheet is 18,278.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Overload List

Insert(Int32,XLColumn,XLCell[]) Method
Position where the item will be inserted.

Item that will be inserted.

Array ot the cells for inserted column.

Inserts an XLColumn object at a specific position in the collection.

Syntax

Visual Basic (Declaration)

```
Public Overloads Function Insert( _
   ByVal index As System.Integer, _
   ByVal col As XLColumn, _
   ByVal cells() As XLCell _
) As XLColumn
```

C#

```
public XLColumn Insert(
   System.int index,
   XLColumn col,
   XLCell[] cells
)
```

Parameters

index

Position where the item will be inserted.

col

Item that will be inserted.

cells

Array ot the cells for inserted column.

Return Value

A reference to the item that was added to the collection.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Remove Method

Item to be removed from the collection.

Removes an XLColumn object from the collection.

Syntax

Visual Basic (Declaration)

```
Public Function Remove( _
   ByVal col As XLColumn _
) As XLColumn
```

C#

```
public XLColumn Remove(
   XLColumn col
)
```

Parameters

col

Item to be removed from the collection.

Return Value

A reference to the item that was removed.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLColumnCollection Class

RemoveAt Method

Index of the item to remove from the collection.

Removes the XLColumn object at a given position from the collection.

Syntax

Visual Basic (Declaration)

```
Public Function RemoveAt( _
   ByVal index As System.Integer _
) As XLColumn
```

C#

```
public XLColumn RemoveAt(
   System.int index
)
```

Parameters

index

Index of the item to remove from the collection.

Return Value

A reference to the item that was removed from the collection.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Book Property

Gets a reference to the parent C1XLBook object.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property Book As C1XLBook
```

C#

```
public C1XLBook Book {get;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLColumnCollection Class
XLColumnCollection Members

Count Property

Gets the number of items in the collection.

Syntax

Visual Basic (Declaration)
`Public ReadOnly Property Count As System.Integer`
C#
`public System.int Count {get;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

XLColumnCollection Members

Frozen Property

Gets or sets the number of frozen columns in the collection.

Syntax

Visual Basic (Declaration)
`Public Property Frozen As System.Integer`

C#

```
public System.int Frozen {get; set;}
```

Remarks

Frozen columns are displayed on the right side of the sheet and do not scroll horizontally. They are useful for displaying row headers.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Item Property
Returns a reference to the XLColumn object at the specified index.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Default Property Item( _
   ByVal index As System.Integer _
) As XLColumn
```

C#

```
public XLColumn this[
   System.int index
]; {get;}
```

Parameters

index

Remarks

The indexer will create a new XLColumn object at the specified position if necessary. It never returns null.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Add Method

Appends an XLComment object to the collection.

Overload List

Overload	Description
Add(XLComment)	Appends an XLComment object to the collection.
Add(Int32,Int32,String)	Creates an XLComment object and appends it to the

	collection.
Add(Int32,Int32,String,String)	Creates an XLComment object and appends it to the collection.
Add(Int32,Int32,String,String,Boolean)	Creates an XLComment object and appends it to the collection.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Add(XLComment) Method
The XLComment object to add to the collection.

Appends an XLComment object to the collection.

Syntax

Visual Basic (Declaration)

```
Public Overloads Function Add( _
   ByVal comment As XLComment _
) As XLComment
```

C#

```
public XLComment Add(
   XLComment comment
)
```

Parameters

comment

The XLComment object to add to the collection.

Return Value

A reference to the object if it was successfully added to the collection, or null if the object could not be added to the collection (usually because it overlaps another comment already in the collection).

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Overload List

Add(Int32,Int32,String) Method
Index of the top row in the comment.

Index of the left column in the comment.

The author of the comment.

Creates an XLComment object and appends it to the collection.

Syntax

Visual Basic (Declaration)

```
Public Overloads Function Add( _
   ByVal rowIndex As System.Integer, _
   ByVal colIndex As System.Integer, _
   ByVal author As System.String _
) As XLComment
```

C#

```
public XLComment Add(
   System.int rowIndex,
   System.int colIndex,
   System.string author
)
```

Parameters

rowIndex

Index of the top row in the comment.

colIndex

Index of the left column in the comment.

author

The author of the comment.

Return Value

A reference to the object if it was successfully added to the collection, or null if the object could not be added to the collection (usually because it overlaps another comment already in the collection).

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Index of the top row in the comment.

Index of the left column in the comment.

The author of the comment.

The context of the comment.

Creates an XLComment object and appends it to the collection.

Syntax

Visual Basic (Declaration)	

```
Public Overloads Function Add( _
   ByVal rowIndex As System.Integer, _
```

```
   ByVal colIndex As System.Integer, _
   ByVal author As System.String, _
   ByVal text As System.String _
) As XLComment
```

C#

```
public XLComment Add(
   System.int rowIndex,
   System.int colIndex,
   System.string author,
   System.string text
)
```

Parameters

rowIndex

Index of the top row in the comment.

colIndex

Index of the left column in the comment.

author

The author of the comment.

text

The context of the comment.

Return Value

A reference to the object if it was successfully added to the collection, or null if the object could not be added to the collection (usually because it overlaps another comment already in the collection).

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Index of the top row in the comment.

Index of the left column in the comment.

The author of the comment.

The text of the comment.

Flag indicating whether to convert author and text to RTF format.

Creates an XLComment object and appends it to the collection.

Syntax

Visual Basic (Declaration)

```
Public Overloads Function Add( _
   ByVal rowIndex As System.Integer, _
   ByVal colIndex As System.Integer, _
   ByVal author As System.String, _
   ByVal text As System.String, _
   ByVal toRtf As System.Boolean _
) As XLComment
```

C#

```
public XLComment Add(
   System.int rowIndex,
   System.int colIndex,
   System.string author,
   System.string text,
   System.bool toRtf
)
```

Parameters

rowIndex

Index of the top row in the comment.

colIndex

Index of the left column in the comment.

author

The author of the comment.

text

The text of the comment.

toRtf

Flag indicating whether to convert author and text to RTF format.

Return Value

A reference to the object if it was successfully added to the collection, or null if the object could not be added to the collection (usually because it overlaps another comment already in the collection).

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Contains Method

The XLComment object to look for.

Checks whether the collection contains a specific XLComment object.

Syntax

Visual Basic (Declaration)

```
Public Function Contains( _
   ByVal comment As XLComment _
) As System.Boolean
```

C#

```
public System.bool Contains(
   XLComment comment
)
```

Parameters

comment

The XLComment object to look for.

Return Value

True if the collection contains the comment, false otherwise.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IndexOf Method

The XLComment object to look for.

Gets the index of a specific XLComment object in the collection.

Syntax

Visual Basic (Declaration)

```
Public Function IndexOf( _
   ByVal comment As XLComment _
) As System.Integer
```

C#

```
public System.int IndexOf(
   XLComment comment
)
```

Parameters

comment

The XLComment object to look for.

Return Value

The position of the object in the collection, or -1 if the object is not a member of the collection.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Insert Method

Position where the object will be inserted.

Object to insert in the collection.

Inserts an XLComment object at a specific position in the collection.

Syntax

Visual Basic (Declaration)

`Public Function Insert( _`
`   ByVal index As System.Integer, _`
`   ByVal comment As XLComment _`
`) As XLComment`

C#

`public XLComment Insert(`
`   System.int index,`
`   XLComment comment`
`)`

Parameters

index

Position where the object will be inserted.

comment

Object to insert in the collection.

Return Value

A reference to the object if it was successfully added to the collection, or null if the object could not be added to the collection (usually because it overlaps another comment already in the collection).

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Remove Method

The XLComment object to remove from the collection.

Removes an XLComment object from the collection.

Syntax

Visual Basic (Declaration)

```
Public Sub Remove( _
   ByVal comment As XLComment _
)
```

C#

```
public void Remove(
   XLComment comment
)
```

Parameters

comment

The XLComment object to remove from the collection.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

RemoveAt Method

Index of the object to remove from the collection.

Removes an XLComment object at a specific position from the collection.

Syntax

Visual Basic (Declaration)

`Public Sub RemoveAt( _`
`   ByVal index As System.Integer _`
`)`

C#

`public void RemoveAt(`
`   System.int index`
`)`

Parameters

index

Index of the object to remove from the collection.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Public Properties

	Name	Description
	Bidirectional	Gets or sets a bidirectional count of text shape of this XLTextShape. (Inherited from C1.WPF.Excel.XLTextShape)
	BottomMargin	Gets or sets the bottom margin of this XLTextShape, in twips. (Inherited from C1.WPF.Excel.XLTextShape)
	Column	Gets or sets the index of the column to which the shape is attached. (Inherited from C1.WPF.Excel.XLShape)
	DashedLineStyle	Gets or sets the dash style of the line or border around the shape. (Inherited from C1.WPF.Excel.XLShape)
	HorizAlign	Gets or sets a horizontal alignment of the text in this XLTextShape. (Inherited from C1.WPF.Excel.XLTextShape)
	Hyperlink	Gets or sets the hyperlink associated with the shape. (Inherited from C1.WPF.Excel.XLShape)
	Id	Gets the unique identifier of the shape. (Inherited from C1.WPF.Excel.XLShape)
	IsEmpty	Overridden. Determines whether the shape is empty.
	LeftMargin	Gets or sets the left margin area of this XLTextShape, in twips. (Inherited from C1.WPF.Excel.XLTextShape)
	LineColor	Gets or sets the color of the border around the shape. (Inherited from C1.WPF.Excel.XLShape)
	LineStyle	Gets or sets the style of the line or border around the shape. (Inherited from C1.WPF.Excel.XLShape)
	LineWidth	Gets or sets the width of the border around the shape, in twips. (Inherited from C1.WPF.Excel.XLShape)

	Locked	Gets or sets a locked of this XLTextShape. (Inherited from C1.WPF.Excel.XLTextShape)
	Orientation	Gets or sets a orientation of this XLTextShape. (Inherited from C1.WPF.Excel.XLTextShape)
	Rectangle	Gets or sets the rectangle that contains the shape, in twips. (Inherited from C1.WPF.Excel.XLShape)
	RightMargin	Gets or sets the right margin of this XLTextShape, in twips. (Inherited from C1.WPF.Excel.XLTextShape)
	Rotation	Gets or sets the rotation of the shape, in degrees. (Inherited from C1.WPF.Excel.XLShape)
	Row	Gets or sets the index of the row to which the shape is attached. (Inherited from C1.WPF.Excel.XLShape)
	Sheet	Gets a reference to the parent XLSheet object. (Inherited from C1.WPF.Excel.XLShape)
	Text	Gets or sets a reference to the text string contained in this XLTextShape. (Inherited from C1.WPF.Excel.XLTextShape)
	TextId	Gets or sets a text identifier of this XLTextShape. (Inherited from C1.WPF.Excel.XLTextShape)
	TextScale	Gets or sets a text scale of this XLTextShape. (Inherited from C1.WPF.Excel.XLTextShape)
	TextToFit	Gets or sets a fit to shape of the text flag of this XLTextShape. (Inherited from C1.WPF.Excel.XLTextShape)
	TopMargin	Gets or sets the top margin of this XLTextShape, in twips. (Inherited from C1.WPF.Excel.XLTextShape)
	VertAlign	Gets or sets a vertical alignment of the text in this XLTextShape. (Inherited

		from C1.WPF.Excel.XLTextShape)
	Visible	Determines whether the shape is visible.
	Workbook	Gets a reference to the parent C1XLBook object. (Inherited from C1.WPF.Excel.XLShape)
	Wrapped	Gets or sets a wrapped text of this XLTextShape. (Inherited from C1.WPF.Excel.XLTextShape)

Top

Public Methods

	Name	Description
	Clone	Creates a new XLShape object that is a copy of the current instance. (Inherited from C1.WPF.Excel.XLShape)

XLCommentShape Class
XLCommentShape Members

XLCommentShape Constructor(String,Int32,Int32)

The text contained in the new XLCommentShape.

The horizontal position of the new shape with respect to the cell, in twips.

The vertical position of the new shape with respect to the cell, in twips.

Initializes a new instance of an XLCommentShape.

Syntax

Visual Basic (Declaration)

```
Public Function New( _
   ByVal text As System.String, _
   ByVal x As System.Integer, _
   ByVal y As System.Integer _
)
```

C#

```
public XLCommentShape(
   System.string text,
   System.int x,
```

```
   System.int y
)
```

Parameters

text

The text contained in the new XLCommentShape.

x

The horizontal position of the new shape with respect to the cell, in twips.

y

The vertical position of the new shape with respect to the cell, in twips.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

XLCommentShape Constructor(String,Double,Double,Double,Double)

The text contained in the new XLCommentShape.

The horizontal position of the image with respect to the cell, in twips.

The vertical position of the image with respect to the cell, in twips.

The width of the image, in twips.

The height of the image, in twips.

Initializes a new instance of an XLCommentShape.

Syntax

Visual Basic (Declaration)	
`Public Function New( _`	

```
   ByVal text As System.String, _
   ByVal x As System.Double, _
   ByVal y As System.Double, _
   ByVal width As System.Double, _
   ByVal height As System.Double _
)
```

C#

```
public XLCommentShape(
   System.string text,
   System.double x,
   System.double y,
   System.double width,
   System.double height
)
```

Parameters

text

The text contained in the new XLCommentShape.

x

The horizontal position of the image with respect to the cell, in twips.

y

The vertical position of the image with respect to the cell, in twips.

width

The width of the image, in twips.

height

The height of the image, in twips.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

XLFont Members

XLFont Constructor(String,Single)

The font name, by default Arial.

The font size in points, by default 10 pt.

Excel font initialization.

Syntax

Visual Basic (Declaration)

```
Public Function New( _
   ByVal fontName As System.String, _
   ByVal fontSize As System.Single _
)
```

C#

```
public XLFont(
   System.string fontName,
   System.float fontSize
)
```

Parameters

fontName

The font name, by default Arial.

fontSize

The font size in points, by default 10 pt.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Equals Method

A Excel font to compare.

Determines whether the specified System.Object instances are considered equal.

Syntax

Visual Basic (Declaration)

```
Public Overrides Function Equals( _
   ByVal obj As System.Object _
) As System.Boolean
```

C#

```
public override System.bool Equals(
   System.object obj
)
```

Parameters

obj

A Excel font to compare.

Return Value

true if the objects are considered equal; otherwise, **false**.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Clone Method

Creates a new XLNamedRange object that is a copy of the current instance.

Syntax

Visual Basic (Declaration)

```
Public Function Clone() As XLNamedRange
```

C#

```
public XLNamedRange Clone()
```

Return Value

A new XLNamedRange object that is a copy of the current instance.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Contains Method

The worksheet containing the cell.

The row index of the cell.

The column index of the cell.

Determines whether the range contains a specific cell.

Syntax

Visual Basic (Declaration)

```
Public Function Contains( _
   ByVal sheet As XLSheet, _
   ByVal row As System.Integer, _
   ByVal col As System.Integer _
) As System.Boolean
```

C#

```
public System.bool Contains(
   XLSheet sheet,
   System.int row,
   System.int col
)
```

Parameters

sheet

The worksheet containing the cell.

row

The row index of the cell.

col

The column index of the cell.

Return Value

True if the current named range contains the specified cell, false otherwise.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

XLNamedRange Members

CellRanges Property

Gets a reference to array of the XLCellRange objects that determines which cells are contained in the current named range.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property CellRanges As XLCellRange()
```

C#

```
public XLCellRange[] CellRanges {get;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLNamedRange Class
XLNamedRange Members

Comment Property

Gets or sets the comment text associated with the current named range.

Syntax

Visual Basic (Declaration)

```
Public Property Comment As System.String
```

C#

```
public System.string Comment {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

IsBuiltInName Property

Determines whether the range has a built-in name.

Syntax

Visual Basic (Declaration)
`Public ReadOnly Property IsBuiltInName As System.Boolean`
C#
`public System.bool IsBuiltInName {get;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IsEmpty Property

Determines whether the current range is empty.

Syntax

Visual Basic (Declaration)
`Public ReadOnly Property IsEmpty As System.Boolean`
C#
`public System.bool IsEmpty {get;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

IsNameOnly Property

Determines whether the current named range has a valid name but does not define a range.

Syntax

Visual Basic (Declaration)
`Public ReadOnly Property IsNameOnly As System.Boolean`
C#
`public System.bool IsNameOnly {get;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Name Property

Gets or sets the name of the current named range.

Syntax

Visual Basic (Declaration)
`Public Property Name As System.String`

C#

```
public System.string Name {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Members

Properties Methods

The following tables list the members exposed by XLNamedRangeCollection.

Public Properties

	Name	Description
	Book	Gets a reference to the parent C1XLBook object.
	Count	Gets the number of XLNamedRange objects in the collection.
	Item	Overloaded. Gets a reference to the XLNamedRange object at the specified index. Returns null if an invalid index is specified.

Top

Public Methods

	Name	Description
	Add	Overloaded. Appends an XLNamedRange object to the collection.
	Clear	Removes all XLNamedRange objects from the collection.
	Contains	Overloaded. Checks whether the collection contains a specific XLNamedRange object.
	IndexOf	Overloaded. Gets the position of an XLNamedRange object in the collection.
	Insert	Inserts an XLNamedRange object at a specific position in the collection.
	Remove	Overloaded. Removes an XLNamedRange object from the collection.
	RemoveAt	Removes an XLNamedRange object at a specific position from the collection.

Add Method

Appends an XLNamedRange object to the collection.

Overload List

Overload	Description
Add(XLNamedRange)	Appends an XLNamedRange object to the collection.
Add(String,XLCellRange)	Creates an XLNamedRange object and appends it to the collection.

Add(String,XLCellRange[])	Creates an XLNamedRange object and appends it to the collection.
Add(String,XLSheet,Int32,Int32)	Creates an XLNamedRange object and appends it to the collection. This overload creates a range containing a single cell.
Add(String,Int32,Int32,Int32,Int32)	Creates an XLNamedRange object and appends it to the collection. This overload allows you to create a 3-D reference to the same range of cells on multiple worksheets.
Add(String,XLSheet,Int32,Int32,Int32,Int32)	Creates an XLNamedRange object and appends it to the collection.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

XLNamedRangeCollection Members

Add(XLNamedRange) Method
The XLNamedRange object to add to the collection.

Appends an XLNamedRange object to the collection.

Syntax

Visual Basic (Declaration)

```
Public Overloads Function Add( _
   ByVal namedRange As XLNamedRange _
) As XLNamedRange
```

C#

```
public XLNamedRange Add(
   XLNamedRange namedRange
)
```

Parameters

namedRange

The XLNamedRange object to add to the collection.

Return Value

A reference to the object if it was successfully added to the collection, or null if the object could not be added (usually because it overlaps another cell range already in the collection).

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

Overload List

Add(String,XLCellRange) Method
The name of the named range to create.

The XLCellRange to include in the named range.

Creates an XLNamedRange object and appends it to the collection.

Syntax

Visual Basic (Declaration)

```
Public Overloads Function Add( _
   ByVal name As System.String, _
   ByVal cellRange As XLCellRange _
) As XLNamedRange
```

C#

```
public XLNamedRange Add(
   System.string name,
   XLCellRange cellRange
)
```

Parameters

name

The name of the named range to create.

cellRange

The XLCellRange to include in the named range.

Return Value

A reference to the object if it was successfully added to the collection, or null if the object could not be added (usually because it overlaps another cell range already in the collection).

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLNamedRangeCollection Members
Overload List

Add(String,XLCellRange[]) Method
The name of the named range to create.

The array of XLCellRange to include in the named range.

Creates an XLNamedRange object and appends it to the collection.

Syntax

Visual Basic (Declaration)
`Public Overloads Function Add( _` `   ByVal name As System.String, _`

```
   ByVal cellRanges() As XLCellRange _
) As XLNamedRange
```

C#

```
public XLNamedRange Add(
   System.string name,
   XLCellRange[] cellRanges
)
```

Parameters

name

The name of the named range to create.

cellRanges

The array of XLCellRange to include in the named range.

Return Value

A reference to the object if it was successfully added to the collection, or null if the object could not be added (usually because it overlaps another cell range already in the collection).

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Overload List

Add(String,XLSheet,Int32,Int32) Method
The name of XLNamedRange object.

The worksheet the range belongs to.

The row index of the cell in the range.

The column index of the cell in the range.

Creates an XLNamedRange object and appends it to the collection. This overload creates a range containing a single cell.

Syntax

Visual Basic (Declaration)

```
Public Overloads Function Add( _
   ByVal name As System.String, _
   ByVal sheet As XLSheet, _
   ByVal rowIndex As System.Integer, _
   ByVal colIndex As System.Integer _
) As XLNamedRange
```

C#

```
public XLNamedRange Add(
   System.string name,
   XLSheet sheet,
   System.int rowIndex,
   System.int colIndex
)
```

Parameters

name

The name of XLNamedRange object.

sheet

The worksheet the range belongs to.

rowIndex

The row index of the cell in the range.

colIndex

The column index of the cell in the range.

Return Value

A reference to the object if it was successfully added to the collection, or null if the object could not be added (usually because it overlaps another cell range already in the collection).

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

XLNamedRangeCollection Class
XLNamedRangeCollection Members
Overload List

Add(String,Int32,Int32,Int32,Int32) Method
The name of XLNamedRange object.

The index of the first XLSheet to include.

The index of the last XLSheet to include.

The index of the top row in the cell range.

The index of the left column in the cell range.

Creates an XLNamedRange object and appends it to the collection. This overload allows you to create a 3-D reference to the same range of cells on multiple worksheets.

Syntax

Visual Basic (Declaration)

```
Public Overloads Function Add( _
   ByVal name As System.String, _
   ByVal firstSheetIndex As System.Integer, _
   ByVal lastSheetIndex As System.Integer, _
   ByVal rowIndex As System.Integer, _
   ByVal colIndex As System.Integer _
) As XLNamedRange
```

C#

```
public XLNamedRange Add(
   System.string name,
   System.int firstSheetIndex,
   System.int lastSheetIndex,
   System.int rowIndex,
   System.int colIndex
```

```
)
```

Parameters

name

The name of XLNamedRange object.

firstSheetIndex

The index of the first XLSheet to include.

lastSheetIndex

The index of the last XLSheet to include.

rowIndex

The index of the top row in the cell range.

colIndex

The index of the left column in the cell range.

Return Value

A reference to the object if it was successfully added to the collection, or null if the object could not be added (usually because it overlaps another cell range already in the collection).

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Overload List

Add(String,XLSheet,Int32,Int32,Int32,Int32) Method
The name of XLNamedRange object.

The worksheet containing the range.

The index of the top row in the cell range.

The index of the left column in the cell range.

The number of rows in the cell range.

The number of columns in the cell range.

Creates an XLNamedRange object and appends it to the collection.

Syntax

Visual Basic (Declaration)

```
Public Overloads Function Add( _
   ByVal name As System.String, _
   ByVal sheet As XLSheet, _
   ByVal rowIndex As System.Integer, _
   ByVal colIndex As System.Integer, _
   ByVal rowCount As System.Integer, _
   ByVal colCount As System.Integer _
) As XLNamedRange
```

C#

```
public XLNamedRange Add(
   System.string name,
   XLSheet sheet,
   System.int rowIndex,
   System.int colIndex,
   System.int rowCount,
   System.int colCount
)
```

Parameters

name

The name of XLNamedRange object.

sheet

The worksheet containing the range.

rowIndex

The index of the top row in the cell range.

colIndex

The index of the left column in the cell range.

rowCount

The number of rows in the cell range.

colCount

The number of columns in the cell range.

Return Value

A reference to the object if it was successfully added to the collection, or null if the object could not be added (usually because it overlaps another cell range already in the collection).

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Contains(XLNamedRange) Method
The XLNamedRange object to look for.

Checks whether the collection contains a specific XLNamedRange object.

Syntax

Visual Basic (Declaration)

```
Public Overloads Function Contains( _
   ByVal namedRange As XLNamedRange _
) As System.Boolean
```

C#

```
public System.bool Contains(
   XLNamedRange namedRange
)
```

Parameters

namedRange

The XLNamedRange object to look for.

Return Value

True if the collection contains the range, false otherwise.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IndexOf(XLNamedRange) Method
The XLNamedRange object to look for.

Gets the position of an XLNamedRange object in the collection.

Syntax

Visual Basic (Declaration)

```
Public Overloads Function IndexOf( _
   ByVal nr As XLNamedRange _
) As System.Integer
```

C#

```
public System.int IndexOf(
   XLNamedRange nr
)
```

Parameters

nr

The XLNamedRange object to look for.

Return Value

The position of the object in the collection, or -1 if the object is not a member of the collection.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Insert Method

The position where the object will be inserted.

The named range to insert in the collection.

Inserts an XLNamedRange object at a specific position in the collection.

Syntax

Visual Basic (Declaration)

```
Public Function Insert( _
   ByVal index As System.Integer, _
   ByVal namedRange As XLNamedRange _
) As XLNamedRange
```

C#

```
public XLNamedRange Insert(
   System.int index,
   XLNamedRange namedRange
)
```

Parameters

index

The position where the object will be inserted.

namedRange

The named range to insert in the collection.

Return Value

A reference to the object if it was successfully added to the collection, or null if the object could not be added (usually because it overlaps another cell range already in the collection).

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

XLOpaqueShape

Represents a shape that was inserted in the sheet using Excel and is preserved but not fully exposed by the C1XLBook component.

Object Model

Syntax

Visual Basic (Declaration)

```
Public Class XLOpaqueShape
   Inherits XLShape
   Implements ICloneable
```

C#

```
public class XLOpaqueShape : XLShape, ICloneable
```

Remarks

C1ExcelBook can load and save all types of shapes present in Excel sheets.

However, only image shapes are fully exposed (as XLPictureShape objects).

All other object types are loaded and saved as **XLOpaqueShape** objects that cannot be modified. These include graphical elements (such as lines, rectangles, and arcs), VBA controls (such as edit boxes, and buttons), and comments.

Inheritance Hierarchy

System.Object
  C1.WPF.Excel.XLShape
    C1.WPF.Excel.XLOpaqueShape

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLOpaqueShape Members
C1.WPF.Excel Namespace

Overview

Represents a shape that was inserted in the sheet using Excel and is preserved but not fully exposed by the C1XLBook component.

Object Model

Syntax

Visual Basic (Declaration)

```
Public Class XLOpaqueShape
   Inherits XLShape
   Implements ICloneable
```

C#

```
public class XLOpaqueShape : XLShape, ICloneable
```

Remarks

C1ExcelBook can load and save all types of shapes present in Excel sheets.

However, only image shapes are fully exposed (as XLPictureShape objects).

All other object types are loaded and saved as **XLOpaqueShape** objects that cannot be modified. These include graphical elements (such as lines, rectangles, and arcs), VBA controls (such as edit boxes, and buttons), and comments.

Properties Methods

The following tables list the members exposed by XLOpaqueShape.

Public Properties

	Name	Description
	Column	Gets or sets the index of the column to which the shape is attached. (Inherited from C1.WPF.Excel.XLShape)
	DashedLineStyle	Gets or sets the dash style of the line or border around the shape. (Inherited from C1.WPF.Excel.XLShape)
	Hyperlink	Gets or sets the hyperlink associated with the shape. (Inherited from C1.WPF.Excel.XLShape)
	Id	Gets the unique identifier of the shape. (Inherited from C1.WPF.Excel.XLShape)
	IsEmpty	Overridden. Determines whether the shape is empty.
	LineColor	Gets or sets the color of the border around the shape. (Inherited from C1.WPF.Excel.XLShape)
	LineStyle	Gets or sets the style of the line or border around the shape. (Inherited from C1.WPF.Excel.XLShape)
	LineWidth	Gets or sets the width of the border around the shape, in twips. (Inherited from C1.WPF.Excel.XLShape)
	Rectangle	Gets or sets the rectangle that contains the shape, in twips. (Inherited from C1.WPF.Excel.XLShape)
	Rotation	Gets or sets the rotation of the shape, in degrees. (Inherited from C1.WPF.Excel.XLShape)
	Row	Gets or sets the index of the row to which the shape is attached. (Inherited from C1.WPF.Excel.XLShape)
	Sheet	Gets a reference to the parent XLSheet object. (Inherited from C1.WPF.Excel.XLShape)
	Workbook	Gets a reference to the parent C1XLBook object. (Inherited from

		C1.WPF.Excel.XLShape)

XLPictureShape

Represents an Image embedded in an XLSheet.

Object Model

Syntax

Visual Basic (Declaration)

```
Public Class XLPictureShape
   Inherits XLShape
   Implements ICloneable
```

C#

```
public class XLPictureShape : XLShape, ICloneable
```

Remarks

XLPictureShape derives from the generic XLShape class to expose properties of images embedded in sheets. These properties include the actual Image as well as information on how it should be displayed, including Brightness, Contrast, and clipping information.

You can add images to cells simply by assigning Image objects directly to the Value property of XLCell objects. In this case, C1XLBook will create and initialize an **XLPictureShape** automatically. However, this method does not provide a lot of flexibility in terms of aligning, scaling, and clipping the image.

A more flexible option is to create an **XLPictureShape** object in code, using the constructor that takes alignment and scaling parameters, and then assign this **XLPictureShape** object to a cell's Value property.

Inheritance Hierarchy

System.Object
  C1.WPF.Excel.XLShape
    C1.WPF.Excel.XLPictureShape

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

The following tables list the members exposed by XLPictureShape.

Public Constructors

	Name	Description
	XLPictureShape Constructor	Overloaded.

Top

Public Properties

	Name	Description
	BottomClip	Gets or sets the bottom clipping area of this XLPictureShape, in twips.
	Brightness	Gets or sets the brightness of this XLPictureShape (between 0 and 1).
	BrightnessInPercents	Gets or sets the brightness in percents of this XLPictureShape (between -100 and 100).
	Column	Gets or sets the index of the column to which the shape is attached. (Inherited from C1.WPF.Excel.XLShape)
	Contrast	Gets or sets the contrast of this XLPictureShape (between 0 and 1).
	ContrastInPercents	Gets or sets the contrast in percents of this XLPictureShape (between -100 and 100).
	DashedLineStyle	Gets or sets the dash style of the line or border around the shape. (Inherited from C1.WPF.Excel.XLShape)
	FileName	Gets or sets the file name of this XLPictureShape.
	Hyperlink	Gets or sets the hyperlink associated with the shape. (Inherited from C1.WPF.Excel.XLShape)
	Id	Gets the unique identifier of the shape. (Inherited from C1.WPF.Excel.XLShape)
	Image	Gets a reference to the Image contained in this XLPictureShape.
	ImageSize	Gets image size in twips.
	IsEmpty	Overridden. Determines whether the shape is empty.
	LeftClip	Gets or sets the left clipping area of this XLPictureShape, in twips.

	LineColor	Gets or sets the color of the border around the shape. (Inherited from C1.WPF.Excel.XLShape)
	LineStyle	Gets or sets the style of the line or border around the shape. (Inherited from C1.WPF.Excel.XLShape)
	LineWidth	Gets or sets the width of the border around the shape, in twips. (Inherited from C1.WPF.Excel.XLShape)
	Rectangle	Gets or sets the rectangle that contains the shape, in twips. (Inherited from C1.WPF.Excel.XLShape)
	RightClip	Gets or sets the right clipping area of this XLPictureShape, in twips.
	Rotation	Gets or sets the rotation of the shape, in degrees. (Inherited from C1.WPF.Excel.XLShape)
	Row	Gets or sets the index of the row to which the shape is attached. (Inherited from C1.WPF.Excel.XLShape)
	Sheet	Gets a reference to the parent XLSheet object. (Inherited from C1.WPF.Excel.XLShape)
	TopClip	Gets or sets the top clipping area of this XLPictureShape, in twips.
	Transparent	Gets or sets the transparent color of this XLPictureShape.
	ViewType	Gets or sets whether this XLPictureShape should be displayed in color, grayscale, or black and white.
	Workbook	Gets a reference to the parent C1XLBook object. (Inherited from C1.WPF.Excel.XLShape)

XLPictureShape Constructor

Overload List

Overload	Description
XLPictureShape Constructor(WriteableBitmap,Int32,Int32)	Initializes a new instance of an XLPictureShape.
XLPictureShape Constructor(WriteableBitmap,Int32,Int32,Int32,Int32)	Initializes a new instance of an XLPictureShape.
XLPictureShape Constructor(WriteableBitmap,Rect)	Initializes a new instance of an XLPictureShape.
XLPictureShape Constructor(WriteableBitmap)	Initializes a new

	instance of an XLPictureShape.
XLPictureShape Constructor(WriteableBitmap,Size,HorizontalAlignment,VerticalAlignment,ImageScaling)	Initializes a new instance of an XLPictureShape.
XLPictureShape Constructor(XLSheet,WriteableBitmap,Double,Double,Double,Double)	Initializes a new instance of an XLPictureShape.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLPictureShape Class
XLPictureShape Members

XLPictureShape Constructor(WriteableBitmap,Int32,Int32)

Example

The image contained in the new XLPictureShape.

The horizontal position of the new shape with respect to the cell, in twips.

The vertical position of the new shape with respect to the cell, in twips.

Initializes a new instance of an XLPictureShape.

Syntax

Visual Basic (Declaration)

```
Public Function New( _
   ByVal img As System.Windows.Media.Imaging.WriteableBitmap, _
   ByVal x As System.Integer, _
   ByVal y As System.Integer _
)
```

C#

```
public XLPictureShape(
   System.Windows.Media.Imaging.WriteableBitmap img,
   System.int x,
   System.int y
)
```

Parameters

img

The image contained in the new XLPictureShape.

x

The horizontal position of the new shape with respect to the cell, in twips.

y

The vertical position of the new shape with respect to the cell, in twips.

Example

The code below adds an image to a cell. The image is rendered in its original size, and is indented from the top left corner of the cell by 30 twips:

- C#

```
// get sheet and cell
XLSheet sheet = c1ExcelBook1.Sheets[0];
XLCell  cell  = sheet[row, col];

// build XLPictureShape
XLPictureShape pic = new XLPictureShape(image, 30, 30);

// assign XLPictureShape to cell
cell.Value = pic;
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Overload List

XLPictureShape Constructor(WriteableBitmap,Int32,Int32,Int32,Int32)

Example

The image contained in the new XLPictureShape.

The horizontal position of the image with respect to the cell, in twips.

The vertical position of the image with respect to the cell, in twips.

The width of the image, in twips.

The height of the image, in twips.

Initializes a new instance of an XLPictureShape.

Syntax

Visual Basic (Declaration)

```
Public Function New( _
   ByVal img As System.Windows.Media.Imaging.WriteableBitmap, _
   ByVal x As System.Integer, _
   ByVal y As System.Integer, _
   ByVal width As System.Integer, _
   ByVal height As System.Integer _
)
```

C#

```
public XLPictureShape(
   System.Windows.Media.Imaging.WriteableBitmap img,
   System.int x,
   System.int y,
   System.int width,
   System.int height
```

)

Parameters

img

The image contained in the new XLPictureShape.

x

The horizontal position of the image with respect to the cell, in twips.

y

The vertical position of the image with respect to the cell, in twips.

width

The width of the image, in twips.

height

The height of the image, in twips.

Example

The code below adds an image to a cell. The image is drawn within a rectangle centered on a cell with a 60 twip edge around it:

- C#

```
// get sheet and cell
XLSheet sheet = c1ExcelBook1.Sheets[0];
XLCell  cell  = sheet[row, col];

// calculate cell size to align picture
Rectangle rc = new Rectangle(0, 0
    sheet.Columns[col].Width,
    sheet.Rows[row].Height);

// add 60 twip edge
rc.Inflate(-60, -60);

// build XLPictureShape
XLPictureShape pic = new XLPictureShape(image,
    rc.X, rc.Y, rc.Width, rc.Height);

// assign XLPictureShape to cell
cell.Value = pic;
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows

Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

XLPictureShape Constructor(WriteableBitmap,Rect)

Example

The image contained in the new XLPictureShape.

The rectangle that specifies the image size and position with respect to the cell, in twips.

Initializes a new instance of an XLPictureShape.

Syntax

Visual Basic (Declaration)

```
Public Function New( _
   ByVal img As System.Windows.Media.Imaging.WriteableBitmap, _
   ByVal rc As System.Windows.Rect _
)
```

C#

```
public XLPictureShape(
   System.Windows.Media.Imaging.WriteableBitmap img,
   System.Windows.Rect rc
)
```

Parameters

img

The image contained in the new XLPictureShape.

rc

The rectangle that specifies the image size and position with respect to the cell, in twips.

Example

The code below adds an image to a cell. The image is drawn within a rectangle centered on a cell with a 60 twip edge around it:

- C#

```
// get sheet and cell
XLSheet sheet = c1ExcelBook1.Sheets[0];
XLCell  cell  = sheet[row, col];

// calculate cell size to align picture
Rectangle rc = new Rectangle(0, 0
    sheet.Columns[col].Width,
    sheet.Rows[row].Height);

// add 60 twip edge
rc.Inflate(-60, -60);

// build XLPictureShape
XLPictureShape pic = new XLPictureShape(image, rc);

// assign XLPictureShape to cell
cell.Value = pic;
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Reference

XLPictureShape Class
XLPictureShape Members
Overload List

XLPictureShape Constructor(WriteableBitmap,Size,HorizontalAlignment,VerticalAlignment,ImageScaling)

The Image contained in the new XLPictureShape.

The size of the cell that will contain the image, in pixels (used for aligning the image).

A **System.Windows.HorizontalAlignment** value that specifies the position of the image in the cell.

A **System.Windows.VerticalAlignment** value that specifies the position of the image in the cell.

An ImageScaling value that specifies the image scaling within the cell.

Initializes a new instance of an XLPictureShape.

Syntax

Visual Basic (Declaration)

```
Public Function New( _
```

```
    ByVal img As System.Windows.Media.Imaging.WriteableBitmap, _
    ByVal cellSize As System.Windows.Size, _
    ByVal align As System.Windows.HorizontalAlignment, _
    ByVal valign As System.Windows.VerticalAlignment, _
    ByVal scale As ImageScaling _
)
```

C#

```
public XLPictureShape(
    System.Windows.Media.Imaging.WriteableBitmap img,
    System.Windows.Size cellSize,
    System.Windows.HorizontalAlignment align,
    System.Windows.VerticalAlignment valign,
    ImageScaling scale
)
```

Parameters

img

The Image contained in the new XLPictureShape.

cellSize

The size of the cell that will contain the image, in pixels (used for aligning the image).

align

A **System.Windows.HorizontalAlignment** value that specifies the position of the image in the cell.

valign

A **System.Windows.VerticalAlignment** value that specifies the position of the image in the cell.

scale

An ImageScaling value that specifies the image scaling within the cell.

Remarks

This constructor automatically calculates the image size, position, and clipping based on the cell and image sizes and on the given alignment and scaling parameters.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Overload List

XLPictureShape Constructor(XLSheet,WriteableBitmap,Double,Double,Double,Double)

XLSheet object that owns the new shape.

The image contained in the new XLPictureShape.

The horizontal position of the image with respect to the sheet, in twips.

The vertical position of the image with respect to the sheet, in twips.

The width of the image, in twips.

The height of the image, in twips.

Initializes a new instance of an XLPictureShape.

Syntax

Visual Basic (Declaration)

```
Public Function New( _
   ByVal sheet As XLSheet, _
   ByVal img As System.Windows.Media.Imaging.WriteableBitmap, _
   ByVal x As System.Double, _
   ByVal y As System.Double, _
   ByVal width As System.Double, _
   ByVal height As System.Double _
)
```

C#

```
public XLPictureShape(
   XLSheet sheet,
   System.Windows.Media.Imaging.WriteableBitmap img,
```

```
   System.double x,
   System.double y,
   System.double width,
   System.double height
)
```

Parameters

sheet

XLSheet object that owns the new shape.

img

The image contained in the new XLPictureShape.

x

The horizontal position of the image with respect to the sheet, in twips.

y

The vertical position of the image with respect to the sheet, in twips.

width

The width of the image, in twips.

height

The height of the image, in twips.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

RightClip	Gets or sets the right clipping area of this XLPictureShape, in twips.
Rotation	Gets or sets the rotation of the shape, in degrees. (Inherited from C1.WPF.Excel.XLShape)
Row	Gets or sets the index of the row to which the shape is attached. (Inherited from C1.WPF.Excel.XLShape)
Sheet	Gets a reference to the parent XLSheet object. (Inherited from C1.WPF.Excel.XLShape)
TopClip	Gets or sets the top clipping area of this XLPictureShape, in twips.
Transparent	Gets or sets the transparent color of this XLPictureShape.
ViewType	Gets or sets whether this XLPictureShape should be displayed in color, grayscale, or black and white.
Workbook	Gets a reference to the parent C1XLBook object. (Inherited from C1.WPF.Excel.XLShape)

BottomClip Property

Gets or sets the bottom clipping area of this XLPictureShape, in twips.

Syntax

Visual Basic (Declaration)

```
Public Property BottomClip As System.Double
```

C#

```
public System.double BottomClip {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Brightness Property

Gets or sets the brightness of this XLPictureShape (between 0 and 1).

Syntax

Visual Basic (Declaration)

```
Public Property Brightness As System.Single
```

C#

```
public System.float Brightness {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

BrightnessInPercents Property

Gets or sets the brightness in percents of this XLPictureShape (between -100 and 100).

Syntax

Visual Basic (Declaration)

```
Public Property BrightnessInPercents As System.Single
```

C#

```
public System.float BrightnessInPercents {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

XLPrintSettings

Provides options and settings for printing XLSheet objects.

Object Model

Syntax

Visual Basic (Declaration)

```
Public Class XLPrintSettings
   Implements ICloneable
```

C#

```
public class XLPrintSettings : ICloneable
```

Remarks

The settings are applied to each sheet and are accessible through the sheet's XLSheet.PrintSettings property.

Note that C1XLBook does not provide any printing services. The settings are used when printing the sheet from Excel.

Inheritance Hierarchy

System.Object
  C1.WPF.Excel.XLPrintSettings

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Properties Methods

The following tables list the members exposed by XLPrintSettings.

Public Constructors

	Name	Description
	XLPrintSettings Constructor	Creates a new instance of the XLPrintSettings class.

Top

Public Properties

	Name	Description
	AlignWithMargins	Gets or sets the align header/footer with page margins used for printed output.
	AutoScale	Gets or sets the scaling mode used for printed output.
	BlackAndWhite	Gets or sets whether to print the sheet in monochrome mode.
	CenterHorizontal	Gets or sets whether the sheet should be centered horizontally on the page when printed.
	CenterVertical	Gets or sets whether the sheet should be centered vertically on the page when printed.

	Copies	Gets or sets the number of copies to print.
	DraftQuality	Gets or sets whether to print the sheet in draft quality mode.
	FitPagesAcross	Fit the sheet to this number of pages across (0 means use as many as needed).
	FitPagesDown	Fit the sheet to this number of pages down (0 means use as many as needed).
	Footer	Gets or sets the string to be displayed as a page footer when the sheet is printed.
	FooterEven	Gets or sets the string to be displayed as a even page footer when the sheet is printed.
	FooterFirst	Gets or sets the string to be displayed as a first page footer when the sheet is printed.
	FooterPictureCenter	Gets or sets the **System.Windows.Media.Imaging.WriteableBitmap** or XLPictureShape for the center part of the footer.
	FooterPictureLeft	Gets or sets the **System.Windows.Media.Imaging.WriteableBitmap** or XLPictureShape for the left part of the footer.
	FooterPictureRight	Gets or sets the **System.Windows.Media.Imaging.WriteableBitmap** or XLPictureShape for the right part of the footer.
	Header	Gets or sets the string to be displayed as a page header when the sheet is printed.
	HeaderEven	Gets or sets the string to be displayed as a even page header when the sheet is printed.

	HeaderFirst	Gets or sets the string to be displayed as a first page header when the sheet is printed.
	HeaderPictureCenter	Gets or sets the **System.Windows.Media.Imaging.WriteableBitmap** or XLPictureShape for the center part of the header.
	HeaderPictureLeft	Gets or sets the **System.Windows.Media.Imaging.WriteableBitmap** or XLPictureShape for the left part of the header.
	HeaderPictureRight	Gets or sets the **System.Windows.Media.Imaging.WriteableBitmap** or XLPictureShape for the right part of the header.
	Landscape	Gets or sets whether to print the sheet in landscape mode.
	MarginBottom	Gets or sets the bottom margin, in inches. Set to a negative value to use the default margin.
	MarginFooter	Gets or sets the footer margin, in inches. Set to a negative value to use the default margin.
	MarginHeader	Gets or sets the header margin, in inches. Set to a negative value to use the default margin.
	MarginLeft	Gets or sets the left margin, in inches. Set to a negative value to use the default margin.
	MarginRight	Gets or sets the right margin, in inches. Set to a negative value to use the default margin.
	MarginTop	Gets or sets the top margin, in inches. Set to a negative value to use the default margin.
	PaperKind	Gets or sets the paper size to use when printing the sheet.

	PrintGridlines	Gets or sets whether the gridlines will be printed.
	PrintHeaders	Gets or sets whether row and column headers (the areas with row numbers and column letters) will be printed.
	PrintPagesInRows	Gets or sets whether to print the pages in rows (across first) or in columns (down first).
	ScaleWithDocument	Gets or sets the scales header/footer with document used for printed output.
	ScalingFactor	Gets or sets the scaling factor (in percent) to use when printing the sheet.
	StartPage	Gets or sets the initial page number to use when printing the sheet.

Name	Description
AlignWithMargins	Gets or sets the align header/footer with page margins used for printed output.
AutoScale	Gets or sets the scaling mode used for printed output.
BlackAndWhite	Gets or sets whether to print the sheet in monochrome mode.
CenterHorizontal	Gets or sets whether the sheet should be centered horizontally on the page when printed.
CenterVertical	Gets or sets whether the sheet should be centered vertically on the page when printed.
Copies	Gets or sets the number of copies to print.
DraftQuality	Gets or sets whether to print the sheet in draft quality mode.

FitPagesAcross	Fit the sheet to this number of pages across (0 means use as many as needed).
FitPagesDown	Fit the sheet to this number of pages down (0 means use as many as needed).
Footer	Gets or sets the string to be displayed as a page footer when the sheet is printed.
FooterEven	Gets or sets the string to be displayed as a even page footer when the sheet is printed.
FooterFirst	Gets or sets the string to be displayed as a first page footer when the sheet is printed.
FooterPictureCenter	Gets or sets the **System.Windows.Media.Imaging.WriteableBitmap** or XLPictureShape for the center part of the footer.
FooterPictureLeft	Gets or sets the **System.Windows.Media.Imaging.WriteableBitmap** or XLPictureShape for the left part of the footer.
FooterPictureRight	Gets or sets the **System.Windows.Media.Imaging.WriteableBitmap** or XLPictureShape for the right part of the footer.
Header	Gets or sets the string to be displayed as a page header when the sheet is printed.
HeaderEven	Gets or sets the string to be displayed as a even page header when the sheet is printed.
HeaderFirst	Gets or sets the string to be displayed as a first page header when the sheet is printed.
HeaderPictureCenter	Gets or sets the **System.Windows.Media.Imaging.WriteableBitmap** or XLPictureShape for the center part of the header.
HeaderPictureLeft	Gets or sets the **System.Windows.Media.Imaging.WriteableBitmap** or XLPictureShape for the left part of the header.
HeaderPictureRight	Gets or sets the **System.Windows.Media.Imaging.WriteableBitmap** or XLPictureShape for the right part of the header.
Landscape	Gets or sets whether to print the sheet in landscape mode.
MarginBottom	Gets or sets the bottom margin, in inches. Set to a negative value to use the default margin.

MarginFooter	Gets or sets the footer margin, in inches. Set to a negative value to use the default margin.
MarginHeader	Gets or sets the header margin, in inches. Set to a negative value to use the default margin.
MarginLeft	Gets or sets the left margin, in inches. Set to a negative value to use the default margin.
MarginRight	Gets or sets the right margin, in inches. Set to a negative value to use the default margin.
MarginTop	Gets or sets the top margin, in inches. Set to a negative value to use the default margin.
PaperKind	Gets or sets the paper size to use when printing the sheet.
PrintGridlines	Gets or sets whether the gridlines will be printed.
PrintHeaders	Gets or sets whether row and column headers (the areas with row numbers and column letters) will be printed.
PrintPagesInRows	Gets or sets whether to print the pages in rows (across first) or in columns (down first).
ScaleWithDocument	Gets or sets the scales header/footer with document used for printed output.
ScalingFactor	Gets or sets the scaling factor (in percent) to use when printing the sheet.
StartPage	Gets or sets the initial page number to use when printing the sheet.

AlignWithMargins Property

Gets or sets the align header/footer with page margins used for printed output.

Syntax

Visual Basic (Declaration)
`Public Property AlignWithMargins As System.Boolean`
C#
`public System.bool AlignWithMargins {get; set;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLPrintSettings Members

AutoScale Property

Gets or sets the scaling mode used for printed output.

Syntax

Visual Basic (Declaration)
`Public Property AutoScale As System.Boolean`
C#
`public System.bool AutoScale {get; set;}`

Remarks

If AutoScale is set to true, then the printed sheet will be automatically scaled to fit the number of pages specified by the FitPagesAcross and FitPagesDown properties.

If AutoScale is set to false, then the printed sheet will be scaled according to the value of the ScalingFactor property.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

BlackAndWhite Property

Gets or sets whether to print the sheet in monochrome mode.

Syntax

Visual Basic (Declaration)
`Public Property BlackAndWhite As System.Boolean`
C#
`public System.bool BlackAndWhite {get; set;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

CenterHorizontal Property

Gets or sets whether the sheet should be centered horizontally on the page when printed.

Syntax

Visual Basic (Declaration)
`Public Property CenterHorizontal As System.Boolean`
C#
`public System.bool CenterHorizontal {get; set;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

CenterVertical Property

Gets or sets whether the sheet should be centered vertically on the page when printed.

Syntax

Visual Basic (Declaration)
`Public Property CenterVertical As System.Boolean`
C#
`public System.bool CenterVertical {get; set;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLPrintSettings Class
XLPrintSettings Members

Copies Property

Gets or sets the number of copies to print.

Syntax

Visual Basic (Declaration)
`Public Property Copies As System.Integer`

C#

```
public System.int Copies {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLPrintSettings Class
XLPrintSettings Members

DraftQuality Property

Gets or sets whether to print the sheet in draft quality mode.

Syntax

Visual Basic (Declaration)

```
Public Property DraftQuality As System.Boolean
```

C#

```
public System.bool DraftQuality {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLPrintSettings Class
XLPrintSettings Members

FitPagesAcross Property

Fit the sheet to this number of pages across (0 means use as many as needed).

Syntax

Visual Basic (Declaration)

```
Public Property FitPagesAcross As System.Integer
```

C#

```
public System.int FitPagesAcross {get; set;}
```

Remarks

Causes C1Excel to select "fit to page" print mode, ignoring the value of the ScalingFactor property. Setting the FitPagesAcross or FitPagesDown properties automatically sets the AutoScale property to true, causing C1Excel to calculate the scaling factor based on the given number of pages and to ignore the value of the ScalingFactor property.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLPrintSettings Class
XLPrintSettings Members

FitPagesDown Property

Fit the sheet to this number of pages down (0 means use as many as needed).

Syntax

Visual Basic (Declaration)

```
Public Property FitPagesDown As System.Integer
```

C#

```
public System.int FitPagesDown {get; set;}
```

Remarks

Setting the FitPagesAcross or FitPagesDown properties automatically sets the AutoScale property to true, causing C1Excel to calculate the scaling factor based on the given number of pages and to ignore the value of the ScalingFactor property.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

Footer Property

Gets or sets the string to be displayed as a page footer when the sheet is printed.

Syntax

Visual Basic (Declaration)

```
Public Property Footer As System.String
```

C#

```
public System.string Footer {get; set;}
```

Remarks

The footer string has the same structure and embedded commands as the header string. See the Header property for details.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

FooterEven Property

Gets or sets the string to be displayed as a even page footer when the sheet is printed.

Syntax

Visual Basic (Declaration)

```
Public Property FooterEven As System.String
```

C#

```
public System.string FooterEven {get; set;}
```

Remarks

The string for a odd page footer in the Footer property. This string has the same structure and embedded commands as the main header string. See the Header property for details.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

FooterFirst Property
Gets or sets the string to be displayed as a first page footer when the sheet is printed.

Syntax

Visual Basic (Declaration)

```
Public Property FooterFirst As System.String
```

C#

```
public System.string FooterFirst {get; set;}
```

Remarks

This string has the same structure and embedded commands as the main header string. See the Header property for details.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

FooterPictureCenter Property

Gets or sets the **System.Windows.Media.Imaging.WriteableBitmap** or XLPictureShape for the center part of the footer.

Syntax

Visual Basic (Declaration)
`Public Property FooterPictureCenter As System.Object`
C#
`public System.object FooterPictureCenter {get; set;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

FooterPictureLeft Property

Gets or sets the **System.Windows.Media.Imaging.WriteableBitmap** or XLPictureShape for the left part of the footer.

Syntax

Visual Basic (Declaration)
`Public Property FooterPictureLeft As System.Object`

C#

```
public System.object FooterPictureLeft {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Header Property

Example

Gets or sets the string to be displayed as a page header when the sheet is printed.

Syntax

Visual Basic (Declaration)
`Public Property Header As System.String`
C#
`public System.string Header {get; set;}`

Remarks

The header string may contain special commands, i.e. placeholders for the page number, current date, or text formatting attributes. Most of these fields are represented by single letters with a leading ampersand ("&").

The page header is divided into 3 sections: left, center, and right. Each section is introduced by a special command ("&L", "&C", and "&R"). All text and all commands following are part of the selected section.

The following commands are available:

&L Start of the left section

&C Start of the centered section

&R Start of the right section

&P Current page number

&N Page count

&D Current date

&T Current time

&A Sheet name

&F File name without path

&Z File path without file name

&G Picture (file name)

&B Bold toggle

&I Italic toggle

&U Underline toggle

&E Double underline toggle

&S Strikeout toggle

&X Superscript toggle

&Y Subscript toggle

&"[FontName]" Set new font

&"[FontName,FontStyle]" Set new font with specified style. The style is in most cases "Regular", "Bold", "Italic", or "Bold Italic".

&[fontheight] Set font height in points.

Example

The code below creates a header with left, center, and right portions.

- C#

```
PrintSettings ps = sheet.PrintSettings;
ps.Header = "&LHeader Left&CHeader Center&RHeader Right";
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

HeaderEven Property

Gets or sets the string to be displayed as a even page header when the sheet is printed.

Syntax

Visual Basic (Declaration)
`Public Property HeaderEven As System.String`
C#
`public System.string HeaderEven {get; set;}`

Remarks

The string for a odd page header in the Header property. This string has the same structure and embedded commands as the main header string. See the Header property for details.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

HeaderFirst Property
Gets or sets the string to be displayed as a first page header when the sheet is printed.

Syntax

Visual Basic (Declaration)

```
Public Property HeaderFirst As System.String
```

C#

```
public System.string HeaderFirst {get; set;}
```

Remarks

This string has the same structure and embedded commands as the main header string. See the Header property for details.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

PrintGridlines Property

Gets or sets whether the gridlines will be printed.

Syntax

Visual Basic (Declaration)
`Public Property PrintGridlines As System.Boolean`
C#
`public System.bool PrintGridlines {get; set;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLPrintSettings Class
XLPrintSettings Members

PrintHeaders Property

Gets or sets whether row and column headers (the areas with row numbers and column letters) will be printed.

Syntax

Visual Basic (Declaration)
`Public Property PrintHeaders As System.Boolean`
C#
`public System.bool PrintHeaders {get; set;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLPrintSettings Class
XLPrintSettings Members

PrintPagesInRows Property

Gets or sets whether to print the pages in rows (across first) or in columns (down first).

Syntax

Visual Basic (Declaration)

```
Public Property PrintPagesInRows As System.Boolean
```

C#

```
public System.bool PrintPagesInRows {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLPrintSettings Class
XLPrintSettings Members

ScaleWithDocument Property

Gets or sets the scales header/footer with document used for printed output.

Syntax

Visual Basic (Declaration)

```
Public Property ScaleWithDocument As System.Boolean
```

C#

```
public System.bool ScaleWithDocument {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

ScalingFactor Property

Gets or sets the scaling factor (in percent) to use when printing the sheet.

Syntax

Visual Basic (Declaration)

```
Public Property ScalingFactor As System.Integer
```

C#

```
public System.int ScalingFactor {get; set;}
```

Remarks

Setting the ScalingFactor property automatically sets the AutoScale property to false, causing C1Excel to use the selected scaling factor and to ignore the value of the FitPagesAcross and FitPagesDown properties.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

XLRange Constructor(Int32,Int32,Int32,Int32)

The index of the top row in the range.

The index of the left column in the range.

The index of the bottom row in the range.

The index of the right column in the range.

Initialization range.

Syntax

Visual Basic (Declaration)

```
Public Function New( _
   ByVal rowFirst As System.Integer, _
```

```
   ByVal colFirst As System.Integer, _
   ByVal rowLast As System.Integer, _
   ByVal colLast As System.Integer _
)
```

C#

```
public XLRange(
   System.int rowFirst,
   System.int colFirst,
   System.int rowLast,
   System.int colLast
)
```

Parameters

rowFirst

The index of the top row in the range.

colFirst

The index of the left column in the range.

rowLast

The index of the bottom row in the range.

colLast

The index of the right column in the range.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

XLRow Members

Collapsed Property

Gets or sets collapsed flag for the row.

Syntax

Visual Basic (Declaration)

```
Public Property Collapsed As System.Boolean
```

C#

```
public System.bool Collapsed {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

Height Property
Gets or sets the height of the row, in twips.

Syntax

Visual Basic (Declaration)

```
Public Property Height As System.Integer
```

C#

```
public System.int Height {get; set;}
```

Remarks

A value of -1 causes the row to be displayed using the sheet's XLSheet.DefaultRowHeight if cells of the row not contain data, otherwise this height of the row depended from used font of the data.

To convert between pixels and twips, use the C1XLBook.TwipsToPixels and PixelsToTwips methods.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

`Public ReadOnly Property IsSubtotal As System.Boolean`
C#
`public System.bool IsSubtotal {get;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

OutlineLevel Property

Gets or sets subtotal outline level for the row.

Syntax

Visual Basic (Declaration)
`Public Property OutlineLevel As System.Integer`
C#
`public System.int OutlineLevel {get; set;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

PageBreak Property

Example

Gets or sets whether there will be a forced page break after this row.

Syntax

Visual Basic (Declaration)
`Public Property PageBreak As System.Boolean`

C#

```
public System.bool PageBreak {get; set;}
```

Example

The code below inserts forced page breaks at every 10th row on a sheet, and clears the breaks at all other rows.

- C#

```
C1.C1Excel.XLSheet sheet = c1XLBook1.Sheets[0];
for (int r = 0; r < sheet.Rows.Count; r++)
{
    sheet.Rows[r].PageBreak = (r > 0 && r % 10 == 0);
}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Sheet Property

Gets a reference to the parent XLSheet object.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property Sheet As XLSheet
```

C#

```
public XLSheet Sheet {get;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

Style Property

Gets or sets the XLStyle object that determines the appearance of the row.

Syntax

Visual Basic (Declaration)
`Public Property Style As XLStyle`
C#
`public XLStyle Style {get; set;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Visible Property

Gets or sets whether the row is visible.

Syntax

Visual Basic (Declaration)
`Public Property Visible As System.Boolean`
C#
`public System.bool Visible {get; set;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

XLRowCollection

Example

Represents a collection of XLRow objects that represent the individual rows in each XLSheet.

Object Model

Syntax

Visual Basic (Declaration)
`Public Class XLRowCollection`
C#
`public class XLRowCollection`

Remarks

The collection has methods for counting, enumerating, adding, and removing rows from the collection.

Example

Note that you can create rows automatically by using the sheet's indexer. For example, the following code retrieves the cell at coordinates (3,3) and in doing so automatically creates four rows and four columns automatically:

- C#

```
C1XLBook book = new C1XLBook();
sheet = book.Sheets[0];
XLCell cell   = sheet[3,3]; // creates 4 rows and 4 columns
```

Inheritance Hierarchy

System.Object
C1.WPF.Excel.XLRowCollection

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Members

Properties Methods

The following tables list the members exposed by XLRowCollection.

Public Properties

	Name	Description
	Book	Gets a reference to the parent C1XLBook object.
	Count	Gets the number of items in the collection.
	Frozen	Gets or sets the number of frozen rows in the collection.
	Item	Returns a reference to the XLRow object at the specified index.
	Sheet	Gets a reference to the parent XLSheet object.

Top

Public Methods

	Name	Description
	Add	Overloaded. Creates a new XLRow object and adds it to the collection.
	Clear	Removes all items from the collection.
	Contains	Determines whether an XLRow is a member of the collection.
	IndexOf	Gets the index of a given XLRow object in the collection.
	Insert	Overloaded. Creates a new XLRow object and inserts it at a specific position in the collection.
	Remove	Removes an XLRow object from the collection.
	RemoveAt	Removes the XLRow object at a given position from the collection.

Add Method
Creates a new XLRow object and adds it to the collection.

Overload List

Overload	Description
Add()	Creates a new XLRow object and adds it to the collection.
Add(XLRow)	Adds an XLRow object to the collection.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Add() Method
Creates a new XLRow object and adds it to the collection.

Syntax

Visual Basic (Declaration)

```
Public Overloads Function Add() As XLRow
```

C#

```
public XLRow Add()
```

Return Value

A reference to the new XLRow object.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

XLRowCollection Class
XLRowCollection Members
Overload List

Add(XLRow) Method
The item to add to the collection.

Adds an XLRow object to the collection.

Syntax

Visual Basic (Declaration)

```
Public Overloads Function Add( _
   ByVal row As XLRow _
) As XLRow
```

C#

```
public XLRow Add(
   XLRow row
)
```

Parameters

row

The item to add to the collection.

Return Value

A reference to the item that was added to the collection (in this case, always the row parameter).

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Contains Method

Item to look for.

Determines whether an XLRow is a member of the collection.

Syntax

Visual Basic (Declaration)

`Public Function Contains( _`
`   ByVal row As XLRow _`
`) As System.Boolean`

C#

`public System.bool Contains(`
`   XLRow row`
`)`

Parameters

row

Item to look for.

Return Value

True if the collection contains the item, False otherwise.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

XLRowCollection Members

IndexOf Method

Item to look for.

Gets the index of a given XLRow object in the collection.

Syntax

Visual Basic (Declaration)

`Public Function IndexOf( _`
`   ByVal row As XLRow _`
`) As System.Integer`

C#

`public System.int IndexOf(`
`   XLRow row`
`)`

Parameters

row

Item to look for.

Return Value

The position of the item in the collection, or -1 if the item is not a member of the collection.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Insert Method

Creates a new XLRow object and inserts it at a specific position in the collection.

Overload List

Overload	Description
Insert(Int32)	Creates a new XLRow object and inserts it at a specific position in the collection.

Insert(Int32,XLRow)	Inserts an XLRow object at a specific position in the collection.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLRowCollection Class
XLRowCollection Members

Insert(Int32) Method
Position where the new item will be inserted.

Creates a new XLRow object and inserts it at a specific position in the collection.

Syntax

Visual Basic (Declaration)

```
Public Overloads Function Insert( _
   ByVal index As System.Integer _
) As XLRow
```

C#

```
public XLRow Insert(
   System.int index
)
```

Parameters

index

Position where the new item will be inserted.

Return Value

A reference to the new item.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLRowCollection Class
XLRowCollection Members
Overload List

Insert(Int32,XLRow) Method
Position where the item will be inserted.

Item that will be inserted.

Inserts an XLRow object at a specific position in the collection.

Syntax

Visual Basic (Declaration)

```
Public Overloads Function Insert( _
   ByVal index As System.Integer, _
   ByVal row As XLRow _
) As XLRow
```

C#

```
public XLRow Insert(
   System.int index,
   XLRow row
)
```

Parameters

index

Position where the item will be inserted.

row

Item that will be inserted.

Return Value

A reference to the item that was added to the collection.

Remarks

The maximum number of XLRow objects in a XLSheet is 65,536. This is a limitation imposed by Excel 2003 and below.

For Excel 2007 and above, the maximum number of XLRow objects in an XLSheet is 1,048,576.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Remove Method

Item to be removed from the collection.

Removes an XLRow object from the collection.

Syntax

Visual Basic (Declaration)

```
Public Function Remove( _
   ByVal row As XLRow _
) As XLRow
```

C#

```
public XLRow Remove(
   XLRow row
)
```

Parameters

row

Item to be removed from the collection.

Return Value

A reference to the item that was removed.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

RemoveAt Method
Index of the item to remove from the collection.

Removes the XLRow object at a given position from the collection.

Syntax

Visual Basic (Declaration)

```
Public Function RemoveAt( _
   ByVal index As System.Integer _
) As XLRow
```

C#

```
public XLRow RemoveAt(
   System.int index
)
```

Parameters

index

Index of the item to remove from the collection.

Return Value

A reference to the item that was removed from the collection.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Book Property

Gets a reference to the parent C1XLBook object.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property Book As C1XLBook
```

C#

```
public C1XLBook Book {get;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLRowCollection Class
XLRowCollection Members

Count Property

Gets the number of items in the collection.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property Count As System.Integer
```

C#

```
public System.int Count {get;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

XLRowCollection Members

Frozen Property

Gets or sets the number of frozen rows in the collection.

Syntax

Visual Basic (Declaration)

```
Public Property Frozen As System.Integer
```

C#

```
public System.int Frozen {get; set;}
```

Remarks

Frozen rows are displayed on the top of the sheet and do not scroll vertically. They are useful for displaying column headers.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Item Property

Returns a reference to the XLRow object at the specified index.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Default Property Item( _
   ByVal index As System.Integer _
) As XLRow
```

C#

```
public XLRow this[
   System.int index
```

```
]; {get;}
```

Parameters

index

Remarks

The indexer will create a new XLRow object at the specified position if necessary. It never returns null.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

XLShape

Represents a shape embedded in an XLSheet.

Object Model

Syntax

Visual Basic (Declaration)

```
Public MustInherit Class XLShape
   Implements ICloneable
```

C#

```
public abstract class XLShape : ICloneable
```

Remarks

Excel sheets may contain many types of embedded shapes, including images, graphical elements, controls, and comments.

The **XLShape** abstract class contains information that is common to all shape types, including the shape's location (Sheet, Row, Column, Rectangle, Rotation), the type of border drawn around the shape (LineWidth, LineColor, LineStyle), the Rotation applied to the shape, and Hyperlink information.

The XLPictureShape class derives from **XLShape** and is used to embed images in sheets.

Inheritance Hierarchy

System.Object
  C1.WPF.Excel.XLShape
    C1.WPF.Excel.XLOpaqueShape
    C1.WPF.Excel.XLPictureShape
    C1.WPF.Excel.XLTextShape

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Rotation Property

Gets or sets the rotation of the shape, in degrees.

Syntax

Visual Basic (Declaration)
`Public Property Rotation As System.Single`

C#

```
public System.float Rotation {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Row Property
Gets or sets the index of the row to which the shape is attached.

Syntax

Visual Basic (Declaration)

```
Public Property Row As System.Integer
```

C#

```
public System.int Row {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Sheet Property
Gets a reference to the parent XLSheet object.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property Sheet As XLSheet
```

C#

```
public XLSheet Sheet {get;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Workbook Property

Gets a reference to the parent C1XLBook object.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property Workbook As C1XLBook
```

C#

```
public C1XLBook Workbook {get;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

XLSheet

Example

Represents individual worksheets in an Excel workbook (C1XLBook).

Object Model

Syntax

Visual Basic (Declaration)
`Public Class XLSheet` `   Implements ICloneable`
C#
`public class XLSheet : ICloneable`

Remarks

Provides indexers to get or set the value of individual cells (XLCell) and to access the Rows and Columns on the sheet.

Example

Use the C1XLBookC1XLBook.Sheets indexer to get an individual sheet. For example, the code below gets a reference to the first sheet on the book, then prints the number of rows and columns on the sheet:

- C#

```
C1XLBook book = new C1XLBook();
XLSheet sheet = book.Sheets[0];
Debug.WriteLine("Sheet has {0} rows and {1} columns",
  sheet.Rows.Count, sheet.Columns.Count);
```

Inheritance Hierarchy

System.Object
  C1.WPF.Excel.XLSheet

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Overview

Example

Represents individual worksheets in an Excel workbook (C1XLBook).

Object Model

Syntax

Visual Basic (Declaration)
`Public Class XLSheet` `   Implements ICloneable`
C#
`public class XLSheet : ICloneable`

Remarks

Provides indexers to get or set the value of individual cells (XLCell) and to access the Rows and Columns on the sheet.

Example

Use the C1XLBookC1XLBook.Sheets indexer to get an individual sheet. For example, the code below gets a reference to the first sheet on the book, then prints the number of rows and columns on the sheet:

- C#

```
C1XLBook book = new C1XLBook();
XLSheet sheet = book.Sheets[0];
Debug.WriteLine("Sheet has {0} rows and {1} columns",
  sheet.Rows.Count, sheet.Columns.Count);
```

Members

Properties Methods

The following tables list the members exposed by XLSheet.

Public Properties

	Name	Description
	Book	Gets a reference to the C1XLBook that owns the sheet.
	ColumnMaxLevel	Gets maximum outline level for columns.
	Columns	Gets a reference to sheet's column collection.
	Comments	Gets an XLCommentCollection that contains the collection of comments that on the sheet.
	ConditionalFormattings	Gets the collection of XLConditionalFormatting objects for the current workbook.
	DefaultColumnWidth	Gets or sets the default column width for the sheet (in twips).
	DefaultRowHeight	Gets or sets the default row height for the sheet (in twips).
	GridColor	Gets or sets the color used to display gridlines.

	Item	Gets the cell at a specified position on the sheet, creating a new cell if necessary.
	Locked	Gets or sets a value that determines if the sheet is locked for editing.
	MaxOutlineLevel	Gets the maximum subtotals outline level for rows or columns.
	MergedCells	Gets an XLCellRangeCollection that contains the collection of cells that are merged on the sheet.
	Name	Gets or sets the name of the XLSheet.
	OutlinesBelow	Gets or sets a value indicating the vertical location of outline buttons.
	OutlinesRight	Gets or sets a value indicating the horizontal location of outline buttons.
	PrintSettings	Gets or sets an XLPrintSettings object that controls how the sheet is printed.
	RowMaxLevel	Gets maximum outline level for rows.
	Rows	Gets a reference to the sheet's row collection.
	Scale	Gets or sets the view scale of this worksheet using percentages.
	SelectedCells	Gets an XLCellRangeCollection that contains the collection of cells that are selected on the sheet.
	Shapes	Gets a reference to the ShapeCollection for the sheet.
	ShowGridLines	Gets or sets whether Excel should show the grid lines when displaying the sheet.
	ShowHeaders	Gets or sets whether Excel should show the row and column headers when displaying the sheet.

	ShowZeros	Gets or sets whether Excel should show the zero values on the sheet.
	TabColor	Gets or sets the color used to display the tab of this sheet.
	TotalsBelowData	Gets whether Excel should show the subtotals data when displaying the sheet.
	Visible	Gets or sets the sheet's visibility.

Top

Public Methods

	Name	Description
	Clone	Creates a copy of this sheet.
	CopyFormula	Copies the formula from a source cell to a destination cell, adjusting relative references.
	GetCell	Gets a reference to a cell at the specified coordinates or null if the cell doesn't exist.
	GetFormattedText	Gets formatted text is using XLStyle format value of the cell.
	GetRangeToRepeat	Returns a value indicating whether print titles are specified for this worksheet. (Print titles are rows repeated at top, and columns repeated at left of each page when the sheet is printed.) Output parameters indicate the indices of title rows and columns.
	Load	Overloaded. Loads the Excel worksheet from a file.
	LoadCsv	Overloaded. Loads data from a file containing comma-separated values (.csv) into the current sheet.
	SaveCsv	Overloaded. Saves data from the current sheet into a comma-separated values (.csv) formatted file.

	SetRangeToRepeat	Specifies the range of rows and columns to use as print titles for this worksheet. (Print titles are rows repeated at top, and columns repeated at left of each page when the sheet is printed.)

Clone Method

Example

Creates a copy of this sheet.

Syntax

Visual Basic (Declaration)

```
Public Function Clone() As XLSheet
```

C#

```
public XLSheet Clone()
```

Return Value

A new XLSheet object with the same contents and formatting as this sheet.

Remarks

After cloning a sheet, you must rename it and then add it to the book (duplicate names are not allowed).

This method is useful for applications that generate books with a large number of similar sheets.

Example

The code below loads a book that contains a template sheet, creates 12 copies of that sheet, removes the template sheet, then saves the file with a new name.

- C#

```
// load book with template sheet
_c1xl.Load(@"c:\temp\template.xls");

// create 12 copies of the template sheet
XLSheet templateSheet = _c1xl.Sheets["Template"];
for (int month = 1; month <= 12; month++)
{
  XLSheet newSheet = templateSheet.Clone();
  newSheet.Name = month.ToString(); // rename clone
  newSheet[0,0].Value = month;      // make changes
  _c1xl.Sheets.Add(newSheet);       // add clone to book
}

// remove the template sheet and save with new name
_c1xl.Sheets.Remove("Template");
_c1xl.Save(@"C:\temp\expense_report.xls");
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLSheet Class
XLSheet Members

CopyFormula Method

The row index of a source cell with exist formula.

The column index of a source cell with exist formula.

The row index of a destination cell for copies the formula.

The column index of a destination cell for copies the formula.

Copies the formula from a source cell to a destination cell, adjusting relative references.

Syntax

Visual Basic (Declaration)	

```
Public Sub CopyFormula( _
   ByVal rowFrom As System.Integer, _
   ByVal colFrom As System.Integer, _
   ByVal rowTo As System.Integer, _
   ByVal colTo As System.Integer _
)
```

C#

```
public void CopyFormula(
   System.int rowFrom,
   System.int colFrom,
   System.int rowTo,
   System.int colTo
)
```

Parameters

rowFrom

The row index of a source cell with exist formula.

colFrom

The column index of a source cell with exist formula.

rowTo

The row index of a destination cell for copies the formula.

colTo

The column index of a destination cell for copies the formula.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLSheet Class
XLSheet Members

GetCell Method

Index of the row.

Index of the column.

Gets a reference to a cell at the specified coordinates or null if the cell doesn't exist.

Syntax

Visual Basic (Declaration)

```
Public Function GetCell( _
   ByVal rowIndex As System.Integer, _
   ByVal colIndex As System.Integer _
) As XLCell
```

C#

```
public XLCell GetCell(
   System.int rowIndex,
   System.int colIndex
)
```

Parameters

rowIndex

Index of the row.

colIndex

Index of the column.

Return Value

A reference to the XLCell object at the specified coordinates, or null if there is no cell at the specified position.

Remarks

To populate new sheets, use the C1XLBook.Sheets indexer instead.

The indexer will automatically create new rows, columns, and cells as needed, and will never return null.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

GetFormattedText Method

Index of the row.

Index of the column.

Gets formatted text is using XLStyle format value of the cell.

Syntax

Visual Basic (Declaration)

```
Public Function GetFormattedText( _
   ByVal rowIndex As System.Integer, _
   ByVal colIndex As System.Integer _
) As System.String
```

C#

```
public System.string GetFormattedText(
   System.int rowIndex,
   System.int colIndex
)
```

Parameters

rowIndex

Index of the row.

colIndex

Index of the column.

Return Value

The formatted text of the cell with row and column indexes.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GetRangeToRepeat Method

OUT: index of the first title row (repeated at top).

OUT: index of the last title row (repeated at top).

OUT: index of the first title column (repeated at left).

OUT: index of the last title column (repeated at left).

Returns a value indicating whether print titles are specified for this worksheet. (Print titles are rows repeated at top, and columns repeated at left of each page when the sheet is printed.) Output parameters indicate the indices of title rows and columns.

Syntax

Visual Basic (Declaration)

```
Public Function GetRangeToRepeat( _
   ByRef rowFrom As System.Integer, _
   ByRef rowTo As System.Integer, _
   ByRef colFrom As System.Integer, _
   ByRef colTo As System.Integer _
) As System.Boolean
```

C#

```
public System.bool GetRangeToRepeat(
   out System.int rowFrom,
   out System.int rowTo,
   out System.int colFrom,
   out System.int colTo
)
```

Parameters

rowFrom

OUT: index of the first title row (repeated at top).

rowTo

OUT: index of the last title row (repeated at top).

colFrom

OUT: index of the first title column (repeated at left).

colTo

OUT: index of the last title column (repeated at left).

Return Value

True if title rows or columns are specified for this sheet, false otherwise.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Load Method

Loads the Excel worksheet from a file.

Overload List

Overload	Description
Load(String,Boolean)	Loads the Excel worksheet from a file.
Load(Stream,Boolean)	Loads the Excel worksheet from a stream.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLSheet Class
XLSheet Members

Load(String,Boolean) Method
Name of the file that contains the worksheet.

True to finish loading from the workbook; **False** to load data into the other worksheets.

Loads the Excel worksheet from a file.

Syntax

Visual Basic (Declaration)

```
Public Overloads Sub Load( _
   ByVal fileName As System.String, _
   ByVal last As System.Boolean _
)
```

C#

```
public void Load(
   System.string fileName,
   System.bool last
)
```

Parameters

fileName

Name of the file that contains the worksheet.

last

True to finish loading from the workbook; **False** to load data into the other worksheets.

Remarks

It was previously necessary to load the workbook from the stream without filling the worksheets.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Overload List

Load(Stream,Boolean) Method
System.IO.Stream that contains the worksheet.

True to finish loading from the workbook; **False** to load data into the other worksheets.

Loads the Excel worksheet from a stream.

Syntax

Visual Basic (Declaration)

```
Public Overloads Sub Load( _
   ByVal stream As System.IO.Stream, _
   ByVal last As System.Boolean _
)
```

C#

```
public void Load(
   System.IO.Stream stream,
   System.bool last
)
```

Parameters

stream

System.IO.Stream that contains the worksheet.

last

True to finish loading from the workbook; **False** to load data into the other worksheets.

Remarks

It was previously necessary to load the workbook from the stream without filling the worksheets.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

LoadCsv(String) Method

The name of a file containing data in .csv format.

Loads data from a file containing comma-separated values (.csv) into the current sheet.

Syntax

Visual Basic (Declaration)

```
Public Overloads Sub LoadCsv( _
   ByVal fileName As System.String _
)
```

C#

```
public void LoadCsv(
   System.string fileName
)
```

Parameters

fileName

The name of a file containing data in .csv format.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

LoadCsv(Stream) Method
A stream containing data in .csv format.

Loads data from a stream containing comma-separated values (.csv) into the current sheet.

Syntax

Visual Basic (Declaration)

```
Public Overloads Sub LoadCsv( _
   ByVal stream As System.IO.Stream _
)
```

C#

```
public void LoadCsv(
   System.IO.Stream stream
)
```

Parameters

stream

A stream containing data in .csv format.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

SaveCsv(String) Method
The target (.csv) file name.

Saves data from the current sheet into a comma-separated values (.csv) formatted file.

Syntax

Visual Basic (Declaration)

```
Public Overloads Sub SaveCsv( _
   ByVal fileName As System.String _
)
```

C#

```
public void SaveCsv(
   System.string fileName
)
```

Parameters

fileName

The target (.csv) file name.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

SetRangeToRepeat Method

Index of the first title row (repeated at top).

Index of the last title row (repeated at top).

Index of the first title column (repeated at left).

Index of the last title column (repeated at left).

Specifies the range of rows and columns to use as print titles for this worksheet. (Print titles are rows repeated at top, and columns repeated at left of each page when the sheet is printed.)

Syntax

Visual Basic (Declaration)

```
Public Sub SetRangeToRepeat( _
   ByVal rowFrom As System.Integer, _
   ByVal rowTo As System.Integer, _
   ByVal colFrom As System.Integer, _
   ByVal colTo As System.Integer _
)
```

C#

```
public void SetRangeToRepeat(
   System.int rowFrom,
   System.int rowTo,
   System.int colFrom,
   System.int colTo
)
```

Parameters

rowFrom

Index of the first title row (repeated at top).

rowTo

Index of the last title row (repeated at top).

colFrom

Index of the first title column (repeated at left).

colTo

Index of the last title column (repeated at left).

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

DefaultColumnWidth Property

Gets or sets the default column width for the sheet (in twips).

Syntax

Visual Basic (Declaration)

```
Public Property DefaultColumnWidth As System.Integer
```

C#

```
public System.int DefaultColumnWidth {get; set;}
```

Remarks

You can set the width of individual rows using the XLColumn class. Any columns that do not have a custom width assigned to them will be displayed using the sheet's DefaultColumnWidth.

The DefaultColumnWidth property is expressed in twips (1/20th of a point), rather than pixels. This allows sheets to maintain their aspect regardless of the resolution of the display.

To convert twips into pixels, use the C1XLBook.TwipsToPixels method in C1XLBook. To convert pixels into twips, use the PixelsToTwips method.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLSheet Class
XLSheet Members

DefaultRowHeight Property
Gets or sets the default row height for the sheet (in twips).

Syntax

Visual Basic (Declaration)

```
Public Property DefaultRowHeight As System.Integer
```

C#

```
public System.int DefaultRowHeight {get; set;}
```

Remarks

You can set the height of individual rows using the XLRow class. Any rows that do not have a custom height assigned to them will be displayed using the sheet's DefaultRowHeight.

The DefaultRowHeight property is expressed in twips (1/20th of a point), rather than pixels. This allows sheets to maintain their aspect regardless of the resolution of the display.

To convert twips into pixels, use the C1XLBook.TwipsToPixels method in C1XLBook. To convert pixels into twips, use the PixelsToTwips method.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLSheet Class
XLSheet Members

GridColor Property
Gets or sets the color used to display gridlines.

Syntax

Visual Basic (Declaration)
`Public Property GridColor As System.Windows.Media.Color`
C#
`public System.Windows.Media.Color GridColor {get; set;}`

Remarks

Set this property to **Color.Transparent** to display the grid lines using the default color.

To hide the grid lines, set the ShowGridLines property to false.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

XLSheet Class
XLSheet Members

Item Property

Gets the cell at a specified position on the sheet, creating a new cell if necessary.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Default Property Item( _
   ByVal rowIndex As System.Integer, _
   ByVal colIndex As System.Integer _
) As XLCell
```

C#

```
public XLCell this[
   System.int rowIndex,
   System.int colIndex
]; {get;}
```

Parameters

rowIndex

colIndex

Remarks

If the specified cell doesn't exist when the indexer is invoked, the sheet will be expanded and a new cell will be created, then returned. This makes it easy to create and populate sheets.

If you want to determine whether a specific cell has been defined, use the GetCell method instead.

The indexer is generally more useful when creating and populating sheets. The GetCell method is more useful when loading existing sheets.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Locked Property
Example

Gets or sets a value that determines if the sheet is locked for editing.

Syntax

Visual Basic (Declaration)
`Public Property Locked As System.Boolean`
C#
`public System.bool Locked {get; set;}`

Remarks

Sheets and styles can be locked. By default, sheets are unlocked and styles are locked. This combination allows users to edit the cells in Excel.

To protect a cell against editing in Excel, both the sheet and the cell style must have the Locked property set to true.

To lock most cells on a sheet and allow editing of only a few cells, lock the sheet, then create an unlocked style and assign it to the cells that should be editable.

Example

The code below creates a data entry sheet. Most cells are locked, except for the ones where the user is supposed to enter data.

- C#

```
// start with a single locked sheet
_c1xl.Clear();
XLSheet sheet = _c1xl.Sheets[0];
sheet.Locked = true;
```

```
// create an unlocked style
XLStyle dataEntry = new XLStyle(_c1xl);
dataEntry.Locked = false;
dataEntry.BackColor = Color.Beige;

// create data entry titles
sheet[0,0].Value = "Name:";
sheet[1,0].Value = "Address:";
sheet[2,0].Value = "Phone #:";

create data entry cells (unlocked)
sheet[0,1].Style = dataEntry;
sheet[1,1].Style = dataEntry;
sheet[2,1].Style = dataEntry;

// save the book
_c1xl.Save(@"c:\temp\Protected.xls");
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

MaxOutlineLevel Property

Gets the maximum subtotals outline level for rows or columns.

Syntax

Visual Basic (Declaration)
`Public ReadOnly Property MaxOutlineLevel As System.Integer`
C#
`public System.int MaxOutlineLevel {get;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

MergedCells Property

Gets an XLCellRangeCollection that contains the collection of cells that are merged on the sheet.

Syntax

Visual Basic (Declaration)
`Public ReadOnly Property MergedCells As XLCellRangeCollection`
C#
`public XLCellRangeCollection MergedCells {get;}`

Remarks

The collection has methods for inspecting, adding, or clearing merged ranges in a sheet. Each merged range is represented by an XLCellRange object.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Name Property

Gets or sets the name of the XLSheet.

Syntax

Visual Basic (Declaration)
`Public Property Name As System.String`

C#

```
public System.string Name {get; set;}
```

Remarks

When you open a workbook in Excel, the sheet names appear in the tabs below the work area.

Sheet names can be used as indexers, so they should be unique.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

OutlinesBelow Property

Gets or sets a value indicating the vertical location of outline buttons.

Syntax

Visual Basic (Declaration)

```
Public Property OutlinesBelow As System.Boolean
```

C#

```
public System.bool OutlinesBelow {get; set;}
```

Remarks

If this property is set to true, outline buttons are located below the outline group, otherwise they are located above the outline group.

Th default value is **true**

.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

OutlinesRight Property
Gets or sets a value indicating the horizontal location of outline buttons.

Syntax

Visual Basic (Declaration)
`Public Property OutlinesRight As System.Boolean`
C#
`public System.bool OutlinesRight {get; set;}`

Remarks

If this property is set to true, outline buttons are located to the right the outline group, otherwise they are located to the left of the outline group.

Th default value is **true**

.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

PrintSettings Property
Example

Gets or sets an XLPrintSettings object that controls how the sheet is printed.

Syntax

Visual Basic (Declaration)

```
Public Property PrintSettings As XLPrintSettings
```

C#

```
public XLPrintSettings PrintSettings {get; set;}
```

Example

The code below creates a header for the sheet and sets the orientation to landscape:

- C#

```
XLPrintSettings pp = sheet.PrintSettings();
pp.Landscape = true;
pp.Header = "&LLeft Header&CCenter Header&RRight Header";
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

RowMaxLevel Property

Gets maximum outline level for rows.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property RowMaxLevel As System.Integer
```

C#

```
public System.int RowMaxLevel {get;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Scale Property

Gets or sets the view scale of this worksheet using percentages.

Syntax

Visual Basic (Declaration)

```
Public Property Scale As System.Integer
```

C#

```
public System.int Scale {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

SelectedCells Property

Gets an XLCellRangeCollection that contains the collection of cells that are selected on the sheet.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property SelectedCells As XLCellRangeCollection
```

C#

```
public XLCellRangeCollection SelectedCells {get;}
```

Remarks

The collection has methods for inspecting, adding, or clearing merged ranges in a sheet. Each selected range is represented by an XLCellRange object.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

XLSheetCollection

Example

Collection of XLSheet objects that represent the individual worksheets in a C1XLBook.

Object Model

Syntax

Visual Basic (Declaration)
`Public Class XLSheetCollection`
C#
`public class XLSheetCollection`

Remarks

Provides methods and properties for counting, enumerating, adding, and removing sheets from the workbook.

Example

Use the C1XLBookC1XLBook.Sheets property to get the book's sheet collection. For example, the code below gets a reference to the first sheet on the book and then prints the sheet's name:

- C#

```
C1XLBook book = new C1XLBook();
XLSheet sheet = book.Sheets[0];
Debug.WriteLine(sheet.Name);
```

Inheritance Hierarchy

System.Object
  C1.WPF.Excel.XLSheetCollection

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Members

Properties Methods

The following tables list the members exposed by XLSheetCollection.

Public Properties

	Name	Description
	Book	Gets a reference to the C1XLBook that owns the collection.
	Count	Gets the number of XLSheet objects in the collection.
	FirstIndex	Gets or sets the index of the sheet that is initially opened when a C1XLBook file is loaded into Excel.
	Item	Overloaded. Gets the XLSheet at a given position in the collection.
	SelectedIndex	Gets or sets the index of the sheet that is selected when a C1XLBook file is loaded into Excel.

Top

Public Methods

	Name	Description
	Add	Overloaded. Creates a new XLSheet and appends it to the collection.
	Clear	Removes all items from the collection.

	Contains	Overloaded. Determines whether the collection contains a specific XLSheet object.
	IndexOf	Overloaded. Gets the index of a given XLSheet in the collection.
	Insert	Overloaded. Creates a new XLSheet and inserts it at a specific position in the collection.
	Remove	Overloaded. Removes an XLSheet from the collection.
	RemoveAt	Removes the XLSheet at a specific index from the collection.

Add Method
Creates a new XLSheet and appends it to the collection.

Overload List

Overload	Description
Add()	Creates a new XLSheet and appends it to the collection.
Add(XLSheet)	Appends an existing XLSheet to the collection.
Add(String)	Creates a new XLSheet with a given name and appends it to the collection.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Add() Method
Creates a new XLSheet and appends it to the collection.

Syntax

Visual Basic (Declaration)

```
Public Overloads Function Add() As XLSheet
```

C#

```
public XLSheet Add()
```

Return Value

A reference to the new XLSheet object.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Add(XLSheet) Method
The object to add to the collection.

Appends an existing XLSheet to the collection.

Syntax

Visual Basic (Declaration)

```
Public Overloads Function Add( _
   ByVal sheet As XLSheet _
) As XLSheet
```

C#

```
public XLSheet Add(
   XLSheet sheet
)
```

Parameters

sheet

The object to add to the collection.

Return Value

A reference to the object that was added to the collection (in this case, always the sheet parameter).

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

```
Public Overloads Function Add( _
   ByVal name As System.String _
) As XLSheet
```

C#

```
public XLSheet Add(
   System.string name
)
```

Parameters

name

The name of the new XLSheet.

Return Value

A reference to the new XLSheet object.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Contains(XLSheet) Method
The object to look for in the collection.

Determines whether the collection contains a specific XLSheet object.

Syntax

Visual Basic (Declaration)

```
Public Overloads Function Contains( _
   ByVal sheet As XLSheet _
) As System.Boolean
```

C#

```
public System.bool Contains(
   XLSheet sheet
)
```

Parameters

sheet

The object to look for in the collection.

Return Value

True if the collection contains the object; False otherwise.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

```
Public Overloads Function Contains( _
   ByVal sheetName As System.String _
) As System.Boolean
```

C#

```
public System.bool Contains(
   System.string sheetName
)
```

Parameters

sheetName

The name of the sheet to look for (case-insensitive).

Return Value

True if the collection contains an XLSheet with the given sheetName; False otherwise.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

```
   ByVal sheet As XLSheet _
) As System.Integer
```

C#

```
public System.int IndexOf(
   XLSheet sheet
)
```

Parameters

sheet

The object to look for.

Return Value

The index of the object in the collection, or -1 if the object is not a member of the collection.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Overload List

Insert(Int32,XLSheet) Method
Position where the item will be inserted.

XLSheet object to add to the collection.

Inserts an XLSheet object into the collection at the specified position.

Syntax

Visual Basic (Declaration)

```
Public Overloads Function Insert( _
   ByVal index As System.Integer, _
   ByVal sheet As XLSheet _
) As XLSheet
```

C#

```
public XLSheet Insert(
   System.int index,
   XLSheet sheet
)
```

Parameters

index

Position where the item will be inserted.

sheet

XLSheet object to add to the collection.

Return Value

A reference to the object that was added to the collection (in this case, always the sheet parameter).

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Remove(XLSheet) Method
The XLSheet object to remove from the collection.

Removes an XLSheet from the collection.

Syntax

Visual Basic (Declaration)

```
Public Overloads Sub Remove( _
   ByVal sheet As XLSheet _
)
```

C#

```
public void Remove(
```

```
   XLSheet sheet
)
```

Parameters

sheet

The XLSheet object to remove from the collection.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Overload List

Remove(String) Method
Name of the sheet to remove from the collection (case-insensitive).

Removes the XLSheet with the specified name from the collection.

Syntax

Visual Basic (Declaration)

```
Public Overloads Sub Remove( _
   ByVal name As System.String _
)
```

C#

```
public void Remove(
   System.string name
)
```

Parameters

name

Name of the sheet to remove from the collection (case-insensitive).

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

RemoveAt Method

Index of the object to remove from the collection.

Removes the XLSheet at a specific index from the collection.

Syntax

Visual Basic (Declaration)

```
Public Sub RemoveAt( _
   ByVal index As System.Integer _
)
```

C#

```
public void RemoveAt(
   System.int index
)
```

Parameters

index

Index of the object to remove from the collection.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

XLStyle

Contains style elements used to define the appearance of the cells.

Object Model

Syntax

Visual Basic (Declaration)

```
Public Class XLStyle
   Implements ICloneable
```

C#

```
public class XLStyle : ICloneable
```

Remarks

Each XLStyle object may define one or more of the following elements: font, format, background color, background pattern, foreground color, alignment, text direction, and word wrapping.

When displaying a cell, Excel combines the row, column, and cell styles and merges the style elements defined in each one in order to determine how the cell should be displayed. The precedence of the styles is: (1) cell, (2) row, (3) column, (4) default style.

Every XLStyle belongs to a C1XLBook, and may be assigned to one or more XLRow, XLColumn, and XLCell objects through their Style property.

Inheritance Hierarchy

System.Object
  C1.WPF.Excel.XLStyle

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Members

Properties Methods

The following tables list the members exposed by XLStyle.

Public Constructors

	Name	Description
	XLStyle Constructor	Creates a new instance of XLStyle and adds it to the specified C1XLBook.

Top

Public Properties

	Name	Description
	AlignHorz	Gets or sets the horizontal alignment for this XLStyle.
	AlignVert	Gets or sets the vertical alignment for this XLStyle.
	BackColor	Gets or sets the background color for this XLStyle.
	BackPattern	Gets or sets the background pattern for this XLStyle.
	BorderBottom	Gets or sets the line style used to draw the bottom border.
	BorderColorBottom	Gets or sets the color used to draw the bottom border.
	BorderColorLeft	Gets or sets the color used to draw the left border.
	BorderColorRight	Gets or sets the color used to draw the right border.

	BorderColorTop	Gets or sets the color used to draw the top border.
	BorderLeft	Gets or sets the line style used to draw the left border.
	BorderRight	Gets or sets the line style used to draw the right border.
	BorderTop	Gets or sets the line style used to draw the top border.
	Diagonal	Gets or sets which diagonal lines to display (none, forward, backward).
	DiagonalColor	Gets or sets the color used to draw the diagonal lines.
	DiagonalStyle	Gets or sets the line style used to draw the diagonal lines.
	Direction	Gets or sets the context reading direction for this XLStyle.
	Font	Gets or sets the font for this XLStyle.
	ForeColor	Gets or sets the foreground color for this XLStyle.
	Format	Gets or sets the format associated with this XLStyle.
	Indent	Gets or sets the indent cell contents for this XLStyle.
	Locked	Gets or sets whether the cell should be locked for editing when the XLSheet is protected.
	PatternColor	Gets or sets the color of the background pattern for this XLStyle.
	Rotation	Gets or sets the rotation for this XLStyle, in degrees.
	ShrinkToFit	Gets or sets whether this XLStyle causes cell contents to shrink to fit.
	WordWrap	Gets or sets whether this XLStyle causes cell contents to wrap.

Clone Method

Creates a new XLStyle object that is a copy of the current instance.

Syntax

Visual Basic (Declaration)

```
Public Function Clone() As XLStyle
```

C#

```
public XLStyle Clone()
```

Return Value

A new XLStyle object that is a copy of the current instance.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Equals Method

XLStyle object to compare to the current instance.

Determines whether two XLStyle objects are equivalent.

Syntax

Visual Basic (Declaration)

`Public Overrides Function Equals( _`
`   ByVal obj As System.Object _`
`) As System.Boolean`

C#

`public override System.bool Equals(`
`   System.object obj`
`)`

Parameters

obj

XLStyle object to compare to the current instance.

Return Value

True if the styles are equivalent, False otherwise.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

FormatDotNetToXL(String) Method
.NET-style format to convert.

Converts a .NET-style format string into an Excel format string.

Syntax

Visual Basic (Declaration)

```
Public Overloads Shared Function FormatDotNetToXL( _
   ByVal fmt As System.String _
) As System.String
```

C#

```
public static System.string FormatDotNetToXL(
   System.string fmt
```

```
)
```

Parameters

fmt

.NET-style format to convert.

Return Value

An Excel-style format string.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

FormatDotNetToXL(String,CultureInfo) Method
.NET-style format to convert.

The **System.Globalization.CultureInfo** object.

Converts a .NET-style format string into an Excel format string.

Syntax

Visual Basic (Declaration)

```
Public Overloads Shared Function FormatDotNetToXL( _
   ByVal fmt As System.String, _
   ByVal culture As System.Globalization.CultureInfo _
) As System.String
```

C#

```
public static System.string FormatDotNetToXL(
   System.string fmt,
   System.Globalization.CultureInfo culture
)
```

Parameters

fmt

.NET-style format to convert.

culture

The **System.Globalization.CultureInfo** object.

Return Value

An Excel-style format string.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

AlignHorz Property

Gets or sets the horizontal alignment for this XLStyle.

Syntax

Visual Basic (Declaration)

```
Public Property AlignHorz As XLAlignHorzEnum
```

C#

```
public XLAlignHorzEnum AlignHorz {get; set;}
```

Remarks

Set the AlignHorz property to XLAlignHorzEnum.Undefined to suppress this style element and use the default horizontal alignment instead (XLAlignHorzEnum.General).

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

AlignVert Property
Gets or sets the vertical alignment for this XLStyle.

Syntax

Visual Basic (Declaration)
`Public Property AlignVert As XLAlignVertEnum`
C#
`public XLAlignVertEnum AlignVert {get; set;}`

Remarks

Set the AlignVert property to XLAlignVertEnum.Undefined to suppress this style element and use the default horizontal alignment instead (XLAlignVertEnum.Bottom).

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLStyle Class
XLStyle Members

BackColor Property
Gets or sets the background color for this XLStyle.

Syntax

Visual Basic (Declaration)
`Public Property BackColor As System.Windows.Media.Color`

C#

```
public System.Windows.Media.Color BackColor {get; set;}
```

Remarks

Set the BackColor property to **Color.Transparent** to suppress this style element and use the default background color instead (white).

All colors on the C1XLBook are mapped to a palette. This means that if you assign colors to styles, save the book, and then load it back, you probably won't get exactly the same colors used when the book was created. You will get a fairly close approximation though.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

BackPattern Property
Gets or sets the background pattern for this XLStyle.

Syntax

Visual Basic (Declaration)

```
Public Property BackPattern As XLPatternEnum
```

C#

```
public XLPatternEnum BackPattern {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

BorderBottom Property

Gets or sets the line style used to draw the bottom border.

Syntax

Visual Basic (Declaration)
`Public Property BorderBottom As XLLineStyleEnum`
C#
`public XLLineStyleEnum BorderBottom {get; set;}`

Remarks

Use the SetBorderStyle method to set all borders at once.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

BorderColorLeft Property
Gets or sets the color used to draw the left border.

Syntax

Visual Basic (Declaration)
`Public Property BorderColorLeft As System.Windows.Media.Color`
C#
`public System.Windows.Media.Color BorderColorLeft {get; set;}`

Remarks

Use the SetBorderColor method to set all borders at once.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

BorderColorRight Property

Gets or sets the color used to draw the right border.

Syntax

Visual Basic (Declaration)
`Public Property BorderColorRight As System.Windows.Media.Color`
C#
`public System.Windows.Media.Color BorderColorRight {get; set;}`

Remarks

Use the SetBorderColor method to set all borders at once.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Direction Property

Gets or sets the context reading direction for this XLStyle.

Syntax

Visual Basic (Declaration)
`Public Property Direction As XLReadingDirection`

C#

```
public XLReadingDirection Direction {get; set;}
```

Remarks

This property used only for East Asian versions of MS Excel.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Font Property

Gets or sets the font for this XLStyle.

Syntax

Visual Basic (Declaration)

```
Public Property Font As XLFont
```

C#

```
public XLFont Font {get; set;}
```

Remarks

Set the Font property to null in order to suppress this style element and use the default font instead. The default font is determined by the book's DefaultFont property.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

XLStyle Class
XLStyle Members

ForeColor Property

Gets or sets the foreground color for this XLStyle.

Syntax

Visual Basic (Declaration)

```
Public Property ForeColor As System.Windows.Media.Color
```

C#

```
public System.Windows.Media.Color ForeColor {get; set;}
```

Remarks

Set the ForeColor property to **Color.Transparent** to suppress this style element and use the default foreground color instead (black).

All colors on the C1XLBook are mapped to a palette. This means that if you assign colors to styles, save the book, and then load it back, you probably won't get exactly the same colors used when the book was created. You will get a fairly close approximation though.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

Format Property

Gets or sets the format associated with this XLStyle.

Syntax

Visual Basic (Declaration)

```
Public Property Format As System.String
```

C#

```
public System.string Format {get; set;}
```

Remarks

Excel uses formats similar, but not identical to .NET. Refer to the Excel documentation for details on how to create format strings.

You can use the FormatXLToDotNet(String) and FormatDotNetToXL(String,CultureInfo) methods to convert common Excel format strings to and from .NET format strings.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Indent Property

Gets or sets the indent cell contents for this XLStyle.

Syntax

Visual Basic (Declaration)

```
Public Property Indent As System.Integer
```

C#

```
public System.int Indent {get; set;}
```

Remarks

This property should be set to values between 0 and 255 (between 0 and 15 for Excel 2003 compatible mode), indent calculate as value multiplied by the step (similar TAB value in the text) is equal 2,5 points (180 twips).

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Locked Property

Gets or sets whether the cell should be locked for editing when the XLSheet is protected.

Syntax

Visual Basic (Declaration)
`Public Property Locked As System.Boolean`
C#
`public System.bool Locked {get; set;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

PatternColor Property

Gets or sets the color of the background pattern for this XLStyle.

Syntax

Visual Basic (Declaration)
`Public Property PatternColor As System.Windows.Media.Color`

C#

```
public System.Windows.Media.Color PatternColor {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Rotation Property

Gets or sets the rotation for this XLStyle, in degrees.

Syntax

Visual Basic (Declaration)

```
Public Property Rotation As System.Integer
```

C#

```
public System.int Rotation {get; set;}
```

Remarks

This property should be set to values between 0 and 180, or 255, as explained below:

Zero means no rotation.

1-90 means 1 to 90 degrees counter-clockwise (90 causes text to be displayed in the vertical direction going up the cell).

91-180 means 1 to 90 degrees clockwise (180 causes text to be displayed in the vertical direction going down the cell).

255 causes letters to be stacked top to bottom and not rotated.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ShrinkToFit Property

Gets or sets whether this XLStyle causes cell contents to shrink to fit.

Syntax

Visual Basic (Declaration)
`Public Property ShrinkToFit As System.Boolean`
C#
`public System.bool ShrinkToFit {get; set;}`

Remarks

Cells that do shrink to fit if content more that cell width.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

WordWrap Property

Gets or sets whether this XLStyle causes cell contents to wrap.

Syntax

Visual Basic (Declaration)

```
Public Property WordWrap As System.Boolean
```

C#

```
public System.bool WordWrap {get; set;}
```

Remarks

Cells that do not wrap will spill onto adjacent cells and will be kept on a single line even if they contain line-break characters.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Members

Properties Methods

The following tables list the members exposed by XLTextShape.

Public Properties

	Name	Description
	Bidirectional	Gets or sets a bidirectional count of text shape of this XLTextShape.
	BottomMargin	Gets or sets the bottom margin of this XLTextShape, in twips.
	Column	Gets or sets the index of the column to which the shape is attached. (Inherited from C1.WPF.Excel.XLShape)
	DashedLineStyle	Gets or sets the dash style of the line or border around the shape. (Inherited from C1.WPF.Excel.XLShape)
	HorizAlign	Gets or sets a horizontal alignment of the text in this XLTextShape.
	Hyperlink	Gets or sets the hyperlink associated with the shape. (Inherited from C1.WPF.Excel.XLShape)
	Id	Gets the unique identifier of the shape. (Inherited from C1.WPF.Excel.XLShape)
	IsEmpty	Determines whether the shape is empty. (Inherited from C1.WPF.Excel.XLShape)

	LeftMargin	Gets or sets the left margin area of this XLTextShape, in twips.
	LineColor	Gets or sets the color of the border around the shape. (Inherited from C1.WPF.Excel.XLShape)
	LineStyle	Gets or sets the style of the line or border around the shape. (Inherited from C1.WPF.Excel.XLShape)
	LineWidth	Gets or sets the width of the border around the shape, in twips. (Inherited from C1.WPF.Excel.XLShape)
	Locked	Gets or sets a locked of this XLTextShape.
	Orientation	Gets or sets a orientation of this XLTextShape.
	Rectangle	Gets or sets the rectangle that contains the shape, in twips. (Inherited from C1.WPF.Excel.XLShape)
	RightMargin	Gets or sets the right margin of this XLTextShape, in twips.
	Rotation	Gets or sets the rotation of the shape, in degrees. (Inherited from C1.WPF.Excel.XLShape)
	Row	Gets or sets the index of the row to which the shape is attached. (Inherited from C1.WPF.Excel.XLShape)
	Sheet	Gets a reference to the parent XLSheet object. (Inherited from C1.WPF.Excel.XLShape)
	Text	Gets or sets a reference to the text string contained in this XLTextShape.
	TextId	Gets or sets a text identifier of this XLTextShape.
	TextScale	Gets or sets a text scale of this XLTextShape.
	TextToFit	Gets or sets a fit to shape of the text flag of this XLTextShape.
	TopMargin	Gets or sets the top margin of this XLTextShape, in twips.

	VertAlign	Gets or sets a vertical alignment of the text in this XLTextShape.
	Workbook	Gets a reference to the parent C1XLBook object. (Inherited from C1.WPF.Excel.XLShape)
	Wrapped	Gets or sets a wrapped text of this XLTextShape.

Top

Public Methods

	Name	Description
	Clone()	Creates a new XLShape object that is a copy of the current instance. (Inherited from C1.WPF.Excel.XLShape)

CompatibilityMode

Specifies limits to sheet size that correspond to specific versions of Microsoft Excel.

Syntax

Visual Basic (Declaration)

```
Public Enum CompatibilityMode
   Inherits System.Enum
```

C#

```
public enum CompatibilityMode : System.Enum
```

Members

Member	Description
Excel2003	Sheets may have up to 65,536 rows and 256 columns. Workbooks may have

	up to 4050 unique cell styles.
Excel2007	Sheets may have up to 1,048,576 rows and 18,278 columns. Workbooks may have up to 65,536 unique cell styles. Workbooks that exceed the Excel2003 limits must be saved in OpenXml format instead of XLS. It may not be possible to open these workbooks with versions earlier than Excel 2007 (C1Excel will still open them correctly).
NoLimits	No size limits are enforced. It may not be possible to open these workbooks with any version of Excel (C1Excel will still open them correctly).

ConsolidationFunction

Specifies consolidation function for sheet subtotals.

Syntax

Visual Basic (Declaration)
`Public Enum ConsolidationFunction`

```
    Inherits System.Enum
```

C#

```
public enum ConsolidationFunction : System.Enum
```

Members

Member	Description
Average	Represents Average function.
Count	Represents Count function.
CountNums	Represents Count Numbers function.
Max	Represents Max function.
Min	Represents Min function.
Product	Represents Product function.
StdDev	Represents StdDev function.
StdDevp	Represents StdDevp function.
Sum	Represents Sum function.
Var	Represents Var function.
Varp	Represents Varp function.

XLAlignHorzEnum

Specifies how to align cell content horizontally within a cell.

Syntax

Visual Basic (Declaration)

```
Public Enum XLAlignHorzEnum
   Inherits System.Enum
```

C#

```
public enum XLAlignHorzEnum : System.Enum
```

Members

Member	Description
Center	Align to cell center.
Fill	Fill cell, repeating content as necessary.
General	Align strings to the left, numbers to the right.
Justify	Justify content horizontally to span the whole cell width.

Left	Align to cell left.
Right	Align to cell right.
Selection	Align to selection center (may span multiple cells).
Undefined	Not specified (use default).

Inheritance Hierarchy

System.Object
  System.ValueType
    System.Enum
      C1.WPF.Excel.XLAlignHorzEnum

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

XLConditionalFormattingType

Conditional formatting type.

Syntax

Visual Basic (Declaration)
`Public Enum XLConditionalFormattingType` `   Inherits System.Enum`
C#
`public enum XLConditionalFormattingType : System.Enum`

Members

Member	Description
AboveAverage	Conditional formatting type is above values then average value.
BelowAverage	Conditional formatting type is below values then average value.
Bottom10	Conditional formatting type is bottom n (rank) values.
Bottom10Percent	Conditional formatting type is bottom n (rank) percent values.
CellIs	Conditional formatting type is cell value.
ContainsText	Conditional formatting type is contains text.
DuplicateValues	Conditional formatting type is duplicate values.
EndsWith	Conditional formatting type is end with.
Expression	Conditional formatting type is formula.
TimePeriod	Conditional formatting type is time periods (today, yesterday ...).
Top10	Conditional formatting type is top n (rank) values.
Top10Percent	Conditional formatting type is top n (rank) percent values.
Unknown	Conditional formatting type is unknown.

Specifies the line style used for the cell borders.

Syntax

Visual Basic (Declaration)
`Public Enum XLLineStyleEnum` `   Inherits System.Enum`
C#
`public enum XLLineStyleEnum : System.Enum`

Members

Member	Description
Dashed	Dashed.
Dotted	Dotted.
Double	Double.
Hair	Hair (one pixel).
Medium	Medium.
MediumDashDotDotted	Medium dash-dot-dot.
MediumDashDotted	Medium dash-dot.

MediumDashed	Medium dashed.
None	No line.
SlantedMediumDashDotted	Slanted dash-dot.
Thick	Thick.
Thin	Thin.
ThinDashDotDotted	Thin dash-dot-dot.
ThinDashDotted	Thin dash-dot.

XLPatternEnum

Specifies the pattern used to fill the cell background.

Syntax

Visual Basic (Declaration)
`Public Enum XLPatternEnum` `   Inherits System.Enum`

C#

```
public enum XLPatternEnum : System.Enum
```

Members

Member	Description
DiagonalCrosshatch	Diagonal crosshatch pattern.
DiagonalStripe	Diagonal stripe pattern (/).
Gray06	6% dotted pattern (least dots).
Gray12	12% dotted pattern (less dots).
Gray25	25% dotted pattern.
Gray50	50% dotted pattern.
Gray75	75% dotted pattern.
HorizontalStripe	Horizontal stripe pattern.
None	No pattern (transparent).
ReverseDiagonalStripe	Reverse diagonal stripe pattern (\).
Solid	Solid background.
ThickDiagonalCrosshatch	Thick diagonal crosshatch pattern.
ThinDiagonalCrosshatch	Thin diagonal crosshatch pattern (diamonds).
ThinDiagonalStripe	Thin diagonal stripe pattern (/).
ThinHorizontalCrosshatch	Thin horizontal crosshatch pattern (squares).
ThinHorizontalStripe	Thin horizontal stripe pattern.

ThinReverseDiagonalStripe	Thin reverse diagonal stripe pattern (\).
ThinVerticalStripe	Thin vertical stripe pattern.
VerticalStripe	Vertical stripe pattern.
