Trademarks

The ComponentOne product name is a trademark and ComponentOne is a registered trademark of GrapeCity, Inc. All other trademarks used herein are the properties of their respective owners.

Warranty

ComponentOne warrants that the media on which the software is delivered is free from defects in material and workmanship, assuming normal use, for a period of 90 days from the date of purchase. If a defect occurs during this time, you may return the defective media to ComponentOne, along with a dated proof of purchase, and ComponentOne will replace it at no charge. After 90 days, you can obtain a replacement for the defective media by sending it and a check for $25 (to cover postage and handling) to ComponentOne.

Except for the express warranty of the original media on which the software is delivered is set forth here, ComponentOne makes no other warranties, express or implied. Every attempt has been made to ensure that the information contained in this manual is correct as of the time it was written. ComponentOne is not responsible for any errors or omissions. ComponentOne's liability is limited to the amount you paid for the product. ComponentOne is not liable for any special, consequential, or other damages for any reason.

Copying and Distribution

While you are welcome to make backup copies of the software for your own use and protection, you are not permitted to make copies for the use of anyone else. We put a lot of time and effort into creating this product, and we appreciate your support in seeing that it is used by licensed users only.

DataGrid for WPF and Silverlight Overview

Add advanced data visualization to your WPF and Silverlight applications with **DataGrid for WPF and Silverlight**. The robust data-bound **C1DataGrid** control makes it easy to display, edit, and analyze tabular data in WPF and Silverlight applications.

DataGrid for WPF and Silverlight includes several key features, such as:

- **Fully Interactive Grid**

Enhance the end-user experience by creating a fully interactive grid. **C1DataGrid** has many built-in interactive features such as column resizing and reordering, editing, sorting, filtering, grouping, freezing, and selecting. See Run-time Interaction for more information.

- **Data Grouping and Totals**

C1DataGrid supports Outlook-style grouping. Simply drag a column header to the area above the grid to group the data. Expandable and collapsible nodes are automatically generated. You can also show calculated aggregate functions or totals in grouped header rows. See Grouping Columns for details.

- **Excel-like Filtering**

By default, **C1DataGrid** supports Excel-like filtering. This type of filtering features a drop-down menu on each column allowing users to create a filter condition. See Filtering Columns for more information.

- **High Performance**

C1DataGrid utilizes both row and column recycling (UI Virtualization) to achieve optimal performance when handling large data sets.

- **Several Built-in Column Types**

C1DataGrid provides many built-in column editors that cover all of the common data types. The built-in editors include text, check box, DateTime picker, combo box and images. You can also choose from a selection of custom column editors including masked text, hyperlink, multi-line text and a color picker. See Column Types for details.

- **RowDetails and Hierarchical Support**

DataGrid also supports a **RowDetails** template for embedding **UIElements** inside a collapsible section of each row. For example, just embed another DataGrid and you can create a master-detail grid for displaying hierarchical data. For more information, see Adding Row Details.

- **Top and Bottom Row Templates**

With **C1DataGrid**'s Top and Bottom row templates you can easily create and add custom rows to the grid. For example, you can design your own filter or total rows and embed any UIElements inside.

- **Multiple Selection Modes**

Give end-users all of the following cell selection options: single cell, single row, single column, single range, multi-row, multi-column, and multi-range. With **C1DataGrid**'s clipboard support, end-users can then easily paste selected cells into any text editor, such as Microsoft Excel.

- **New Row**

Allow users to add new rows to **C1DataGrid** by displaying an empty new row at either the top or bottom of the grid. See Adding Rows to the Grid and Setting New Row Visibility for details.

- **Custom Rows and Columns**

Design your own data template for each DataGrid row and create composite columns which can combine data from multiple data fields.

- **Easily Change Colors with ClearStyle**

C1DataGrid supports ComponentOne's new ClearStyle™ technology that allows you to easily change control colors without having to change control templates. With just setting a few color properties you can quickly style the entire grid. For details, see C1DataGrid ClearStyle.

Help with WPF and Silverlight Edition

- For information on installing **ComponentOne Studio WPF Edition**, licensing, technical support, namespaces, theming and localization, and creating a project with the control, please visit Getting Started with WPF Edition.
- For information on installing **ComponentOne Studio Silverlight Edition**, licensing, technical support, namespaces, theming and localization, and creating a project with the control, please visit Getting Started with Silverlight Edition.

Getting Started

Quick Start

The following quick start guide is intended to get you up and running with **DataGrid for WPF and Silverlight**. In this quick start you'll start in Visual Studio and create a new project, add **C1DataGrid** to your application, and add a data source. You'll then move to Microsoft Expression Blend to complete binding the grid to the data source, customize the grid, and run the grid application to observe run-time interactions.

See Also

Step 1 of 4: Adding C1DataGrid to your Project

Step 2 of 4: Creating the Data Model

Step 3 of 4: Setting the ItemsSource

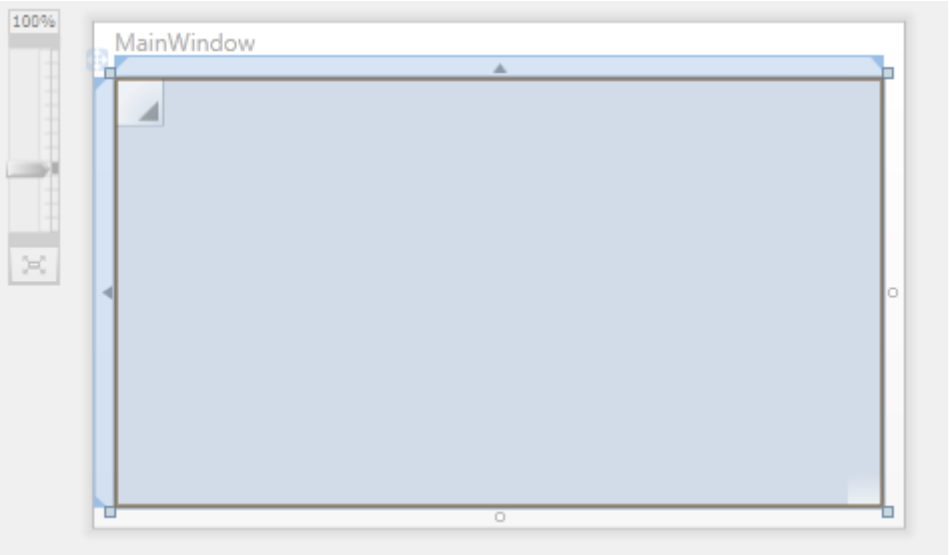
Step 4 of 4: Running the Grid Application

Step 1 of 4: Adding C1DataGrid to your Project

In this step you'll begin in Visual Studio to create a grid application using DataGrid for WPF. When you add the **C1DataGrid** control to your application, you'll have a complete, functional grid. You can further customize the grid to your application.

To set up your project and add a **C1DataGrid** control to your application, complete the following steps:

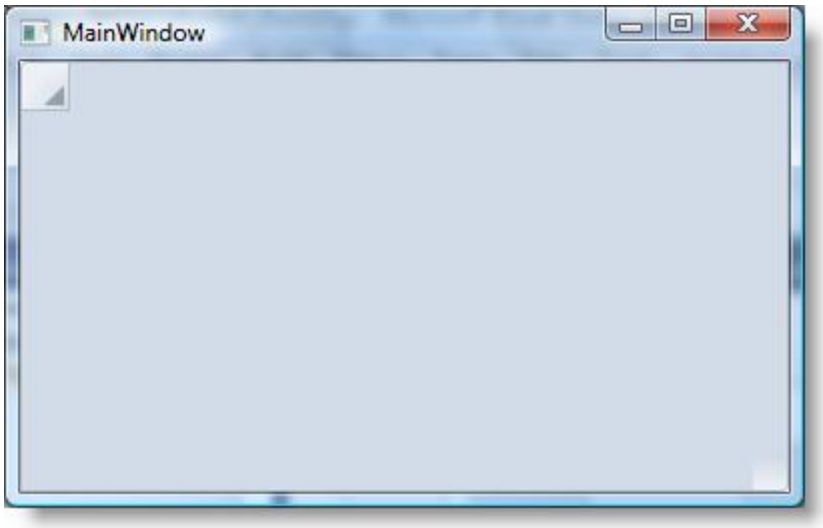
1. Create a new WPF project in Visual Studio.
2. Navigate to the Toolbox and double-click the **C1DataGrid** icon to add the grid control to Window1.
3. Resize the Window and the **C1DataGrid** within the Window; it should now look similar to the following:



4. Name the **C1DataGrid** control by setting its Name property to “ProductsDataGrid”.

What You've Accomplished

Run the application and observe that the grid application will appear similar to the following image:



You've successfully created a very basic grid application, but the grid is blank. In the next step you'll add a data source to your project and bind the grid to the data source.

Step 2 of 4: Creating the Data Model

In the last step you set up the grid application – but while the basic grid is functional, it contains no data. In this step you'll add a data model to your project that you will later use to generate data to display in the **C1DataGrid** control.

1. To add a data model, complete the following steps:
2. Right-click the project node and select **Add | Class....**
3. Name the class – Product.cs and click **OK**.
4. Replace the generated Product class code with the following:

C#	Copy Code

```
public class Product
{
    static Random _rnd = new Random();
    static string[] _names = "Macko|Surfair|Pocohey|Studeby".Split('|');
    static string[] _lines = "Computers|Washers|Stoves|Cars".Split('|');
    static string[] _colors = "Red|Green|Blue|White".Split('|');

    public Product()
    {
        Name = _names[_rnd.Next() % _names.Length];
        Line = _lines[_rnd.Next() % _lines.Length];
        Color = _colors[_rnd.Next() % _colors.Length];
```

```
        Price = 30 + _rnd.NextDouble() * 1000;
        Cost = 3 + _rnd.NextDouble() * 300;
        Discontinued = _rnd.NextDouble() < .2;
        Introduced = DateTime.Today.AddDays(_rnd.Next(-600, 0));
    }

    public string Name { get; set; }
    public string Color { get; set; }
    public string Line { get; set; }
    public double Price { get; set; }
    public double Cost { get; set; }
    public DateTime Introduced { get; set; }
    public bool Discontinued { get; set; }
}
```

Step 3 of 4: Setting the ItemsSource

In the last step you added a data model named Product. In this step you will generate a collection of data objects using this model, and set this list to display in the C1DataGrid control.

To display a collection of data objects in the **C1DataGrid** control, complete the following steps:

1. Open MainWindow.cs or MainWindow.vb.
2. After the boiler-plate initialization code, add the following code which generates a list of 100 random products:

C#	Copy Code

```
List<Product> _products = new List<Product>();
for(int i = 0; i < 100; i++)
{
    _products.Add(new Product());
}
```

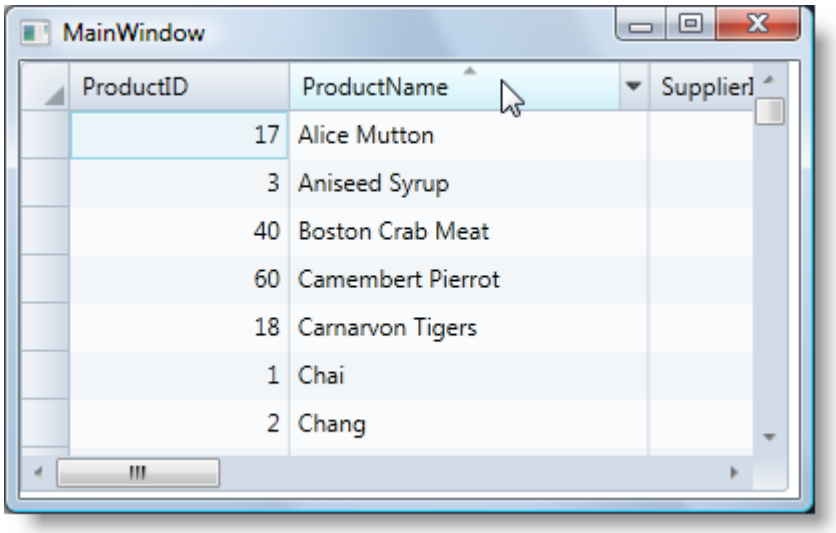
3. Set the ItemsSource property of the **C1DataGrid** to the collection of products. We named our **C1DataGrid** control as "ProductsDataGrid" back in step 1.

   ProductsDataGrid.ItemsSource = _products.

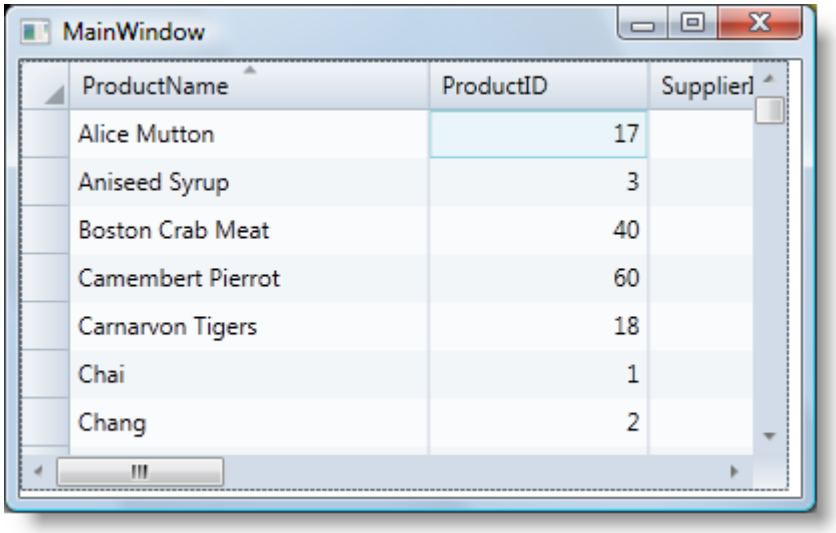
Step 4 of 4: Running the Grid Application

Now that you've created a grid application and bound the grid to a database, the only thing left to do is run your application. To run your grid application and observe Grid for WPF's run-time behavior, complete the following steps:

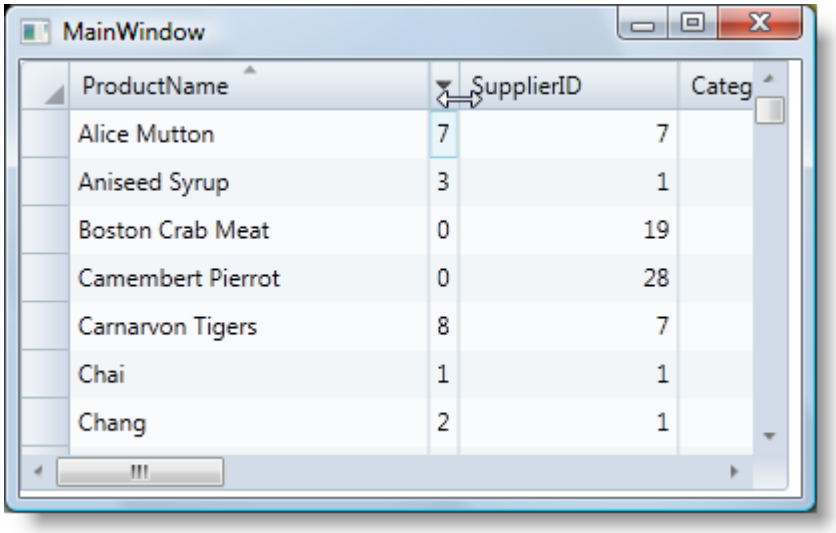
1. From the Debug menu, select **Start Debugging** to view how your grid application will appear at run time.
2. Click the **ProductName** header to sort the grid by product name. Notice that a sort indicator glyph appears to indicate the column being sorted and the direction of the sort.



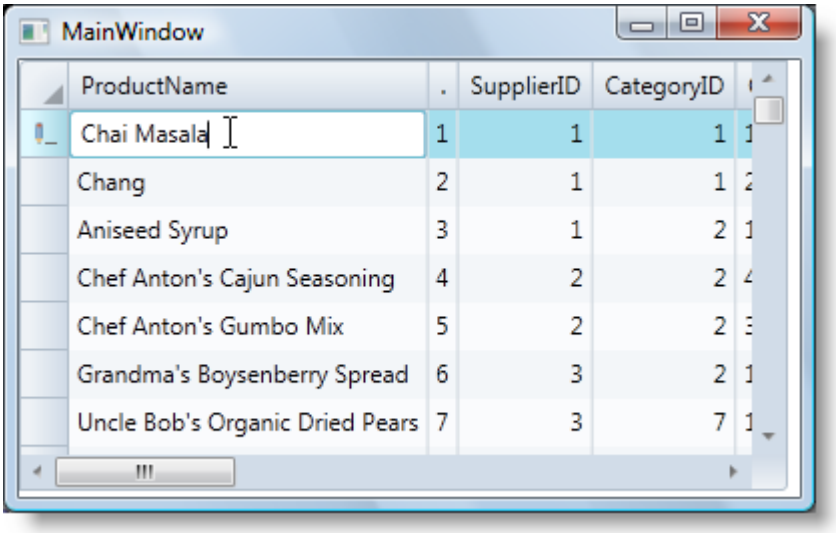
3. Re-order the columns by clicking the ProductName column header and dragging it in front of the ProductID column header. The ProductName column will now appear as the first column in the grid:



4. Resize a column, here the **ProductID** column, by clicking the right edge of the column and dragging the edge to a new location.



5. Click once on a cell, edit the contents of that cell, and press the ENTER key.



Congratulations! You've completed the DataGrid for WPF quick start and created a DataGrid for WPF grid application, bound the grid to a data source, and viewed some of the run-time capabilities of your grid application.

Class hierarchy

The following list summarizes the class relationships between the more important classes included in **C1DataGrid**:

- **C1.WPF.DataGrid.C1DataGrid : System.Windows.Controls.Control**
  Encapsulates most of the grid functionality. This component is shown in Visual Studio's Toolbox.
- **C1.WPF.DataGrid.DataGridColumn : System.Object**
  Represents a column in the grid.
- **C1.WPF.DataGridColumnCollection : System.Object**
  Represents the collection of columns of the data grid.
- **C1.WPF.DataGrid.DataGridColumnHeaderPresenter : System.Windows.Controls.Control**
  Content control that represent the header of a column; this control contains the sort, resize and filter elements.
- **C1.WPF.DataGrid.DataGridRow : System.Object**
  Represents a row in the grid.
- **C1.WPF.DataGridRowCollection : System.Object**
  Collection of rows.
- **C1.WPF.DataGrid.DataGridCell : System.Object**
  Represents an individual cell.

Creating a C1DataGrid in Expression Blend

To create a C1DataGrid control in Blend, complete the following steps:

1. Navigate to the Projects window and right-click the **References** folder in the project files list. In the context menu choose **Add Reference**, locate and select the C1.WPF.DataGrid.dll assembly, and click **Open**.

The dialog box will close and the references will be added to your project and the controls will be available in the Asset Library.

2. In the Toolbox click on the **Assets** button (the double chevron icon) to open the Assets dialog box.
3. In the **Asset Library** dialog box, choose the **Controls** item in the left pane, and then click on the **C1DataGrid** icon in the right pane:

The **C1DataGrid** icon will appear in the Toolbox under the **Assets** button.

4. Click once on the design area of the UserControl to select it. Unlike in Visual Studio, in Blend you can add WPF controls directly to the design surface as in the next step.
5. Double-click the **C1DataGrid** icon in the Toolbox to add the control to the panel. The **C1DataGrid** control will now exist in your application.
6. If you choose, can customize the control by selecting it and setting properties in the Properties window. For example, set the **C1DataGrid** control's **Name** property to "c1datagrid1" the **Height** property to "180", and the **Width** property to "250".

Main Concepts and Properties

In order to use the C1DataGrid to create an application that enables you to read and write to most databases it is useful to understand how the main properties map into datagrid elements.

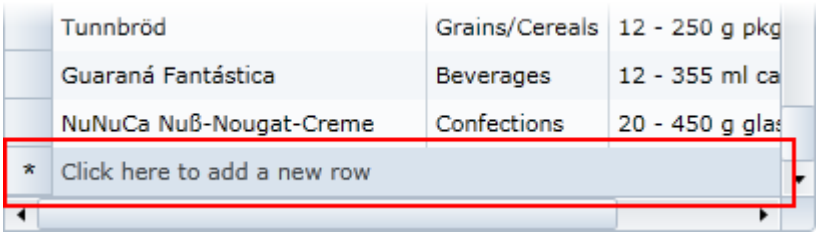
The steps involved in displaying and editing the datagrid are:

1. You can automatically generate the column's headers in the grid by either binding the grid by setting the ItemsSource property to an IEnumberable implementation or by using the **DataGridColumn Collection Editor**.
2. Once the data is set for the grid you can determine whether or not you want to generate the columns automatically or configure the columns explicitly. Set the AutoGenerateColumns property to False to configure the columns explicitly or True to generate the columns automatically.
3. You can then edit (delete, rearrange, and add) the datagrid's columns. For more information see Run-time Interaction.

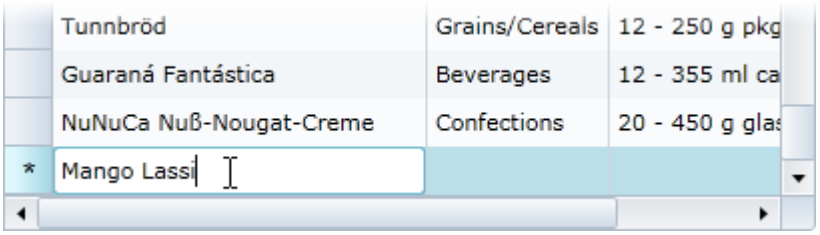
DataGrid Features

Add New Row

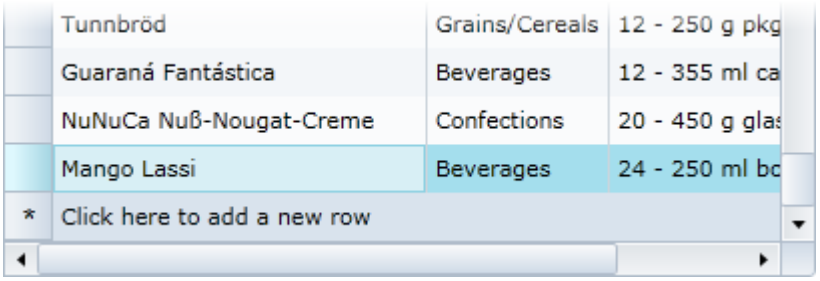
You can add rows to the grid at run time using the new row bar. The new row bar, located at the bottom of the grid by default and indicated by an asterisk symbol (*), allows you to type in new information to add to the grid at run time:



To add a new row, simply type text into the new row bar:



Press ENTER for text to be added to the grid in a new row:



Note: The **CanUserAddRows** property must be set to **True** (default) for row adding to be

possible. See Disabling Adding Rows for an example.

Disable Adding New Rows

By default end users add new rows and content to the grid at run time. A new row bar appears at the bottom of the grid, users can enter text in the bar to add new content to the grid. For more information, see Adding Rows to the Grid. If you choose, however, you can disable the new row bar feature by setting the CanUserAddRows property to False.

At Design Time

To disable adding rows, complete the following steps:

1. Click the C1DataGrid control once to select it.
2. Navigate to the Properties window and locate the **CanUserAddRows** property.
3. Clear the check box next to the **CanUserAddRows** property.

In XAML

For example to disable adding rows, add CanUserEditRows="False" to the < c1:C1DataGrid> tag so that it appears similar to the following:

```
<c1:C1DataGrid Name="c1datagrid1" Height="180" Width="250" CanUserAddRows="False" />
```

In Code

For example, to disable adding rows, add the following code to your project:

Visual Basic	Copy Code
Me.C1DataGrid1.CanUserAddRows = False	
C#	Copy Code
this.c1DataGrid1.CanUserAddRows = false;	

What You've Accomplished

Run the application and scroll to the end of the grid, if needed. Observe that the new row bar no longer appears in the grid and that users can no longer add new rows and content to the grid. For more information about cell editing, see the Adding Rows to the Grid topic.

Column and Row Resizing

By default end users can resize columns and rows in the grid at run time. For more information, see Resizing Columns and Rows. If you choose, however, you can disable the column and row resizing feature by setting the C1DataGrid.CanUserResizeColumns and C1DataGrid.CanUserResizeRows properties to **False**.

At Design Time

To disable column and row resizing, complete the following steps:

1. Click the C1DataGrid control once to select it.
2. Navigate to the Properties window and locate the **CanUserResizeColumns** property.
3. Clear the check box next to the **CanUserResizeColumns** property.
4. In the Properties window, locate the **CanUserResizeRows** property.
5. Clear the check box next to the **CanUserResizeRows** property.

In XAML

For example to disable column and row resizing, add CanUserResizeColumns="False" CanUserResizeRows="False" to the <c1:C1DataGrid> tag so that it appears similar to the following:

```
<c1:C1DataGrid Name="c1datagrid1" Height="180" Width="250"
CanUserResizeColumns="False" CanUserResizeRows="False"/>
```

In Code

For example, to disable column and row resizing, add the following code to your project:

Visual Basic	Copy Code

```
Me.C1DataGrid1.CanUserResizeColumns = False
Me.C1DataGrid1.CanUserResizeRows = False
```

C#	Copy Code

```
this.c1DataGrid1.CanUserResizeColumns = false;
this.c1DataGrid1.CanUserResizeRows = false;
```

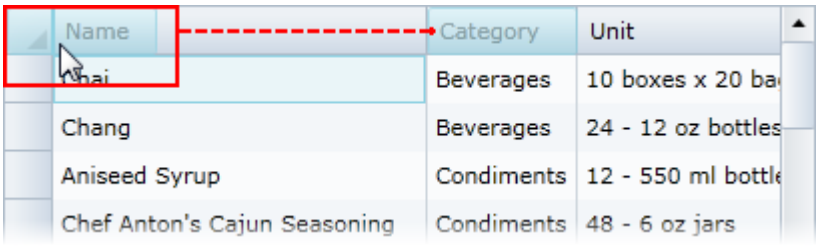
What You've Accomplished

Run the application and observe that you can no longer resize columns or rows at run time by preforming a drag-and-drop operation. For more information about column reordering, see the Resizing Columns and Rows topic.

Column Reordering

End users can easily reorder columns at run time. To reorder columns at run time, complete the following steps:

1. Click the column header for the column you wish to reorder.
2. Drag the column header to where you wish the column to be ordered. Notice that a line will appear if you can place the column in that location:



3. Release the mouse to place the column in its new location and reorder the columns.

Note: The **CanUserReorderColumns** property must be set to True (default) for column reordering to be possible.

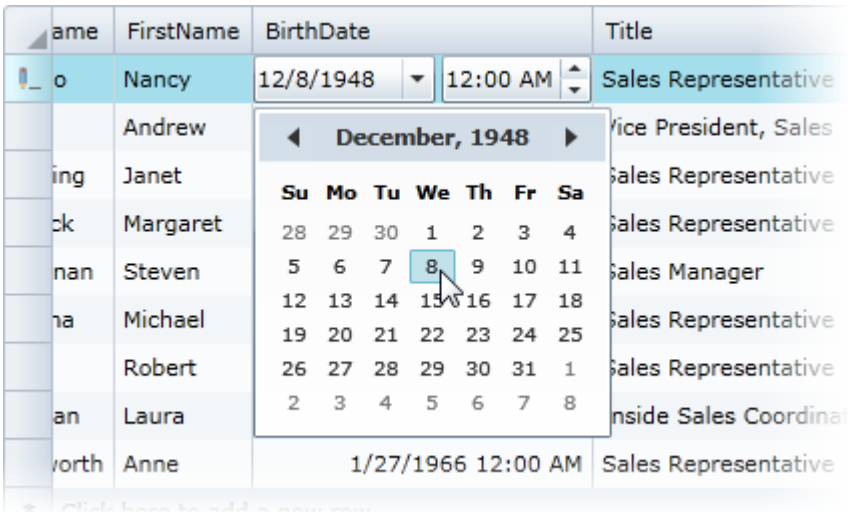
Column Types

DataGrid for WPF provides a flexible way to display a collection of data in rows and columns by providing many built-in column editors that cover all of the common data types. Built-in column types include:

Column Type	Description
DataGridBoundColumn	A column that can bind to a property in the grid's data source. This is the default column type for bound undefined data.
DataGridTextColumn	A text column. This is the default column type for bound string data.
DataGridCheckBoxColumn	A checkbox column. This is the default column type for bound

	Boolean data.
DataGridComboBoxColumn	A combobox column. This is the default column type for bound enumeration type data.
DataGridDateTimeColumn	A date time column (see below for an image). This is the default column type for bound date/time data.
DataGridImageColumn	An image column.
DataGridNumericColumn	A numeric column. This is the default column type for bound numeric data (the format will be inferred from the type. For example, if the type is **int**, the format will not contain decimal places).
DataGridTemplateColumn	A template column for hosting custom content.
CustomColumns	A custom column. See the **C1DataGrid_Demo** sample for examples of custom columns like a Composite Column, Color Column, Gif Column, Hyperlink Column, Masked Text Column, Multi line Text Column, and so on.

These column types can provide built-in input validation; for example the **DataGridDateTimeColumn** column includes a calendar for selecting a date:



Custom Columns

Customizing Column Cell Content

In this section you'll find information about changing the UI element shown as the content of cells belonging to a column when the cell is not in editing mode.

It's important to note that cell content UI elements are recycled by the data grid; that means that this column could potentially use UI elements created by other columns.

To implement custom cell content you'll need to override the following methods:

- **GetCellContentRecyclingKey:** Key used to store the cell content for future reuse in a shared pool. Columns returning the same RecyclingKey will be candidates to share the same cell content instances.
- **CreateCellContent:** Creates the visual element that will be used to display the information inside a cell.
- **BindCellContent:** Initializes the cell content presenter. This method must set cellContent properties, the SetBinding of the corresponding dependency property being "row.DataItem", the source which can be set directly in the binding or in the DataContext of the cellContent.
- **UnbindCellContent:** This method is called before the cell content is recycled.

In the implementation of a hyperlink column the methods might look similar to the example below. In the following method a different key for this column is returned (the default key is typeof(TextBlock)), That means this column will not share the cell content element with other columns (unless it would be another column which returned the same key, but that's not likely to happen).

Visual Basic	Copy Code

```
Public Overloads Overrides Function GetCellContentRecyclingKey(ByVal row As
DataGridRow) As Object
    Return (GetType(HyperlinkButton))
End Function
```

C#	Copy Code

```
public override object GetCellContentRecyclingKey(DataGridRow row)
{
    return typeof(HyperlinkButton);
```

```
}
```

The CreateCellContent method will be called by the data grid if there is no recycled hyperlink. In this case a new hyperlink will be created which will be used in the cell once the cell that contains the hyperlink is unloaded; the hyperlink will be saved to be used in a future cell:

Visual Basic	Copy Code

```
Public Overloads Overrides Function CreateCellContent(ByVal row As
DataGridRow) As FrameworkElement
    Return New HyperlinkButton()
End Function
```

C#	Copy Code

```
public override FrameworkElement CreateCellContent(DataGridRow row)
{
    return new HyperlinkButton();
}
```

After the hyperlink is created or a recycled one is taken, the BindCellContent method will be called by the data grid passing the hyperlink as a parameter. In this method you should set the properties of the hyperlink to bind it to the data of the cell:

Visual Basic	Copy Code

```
Public Overloads Overrides Sub BindCellContent(ByVal cellContent As
FrameworkElement, ByVal row As DataGridRow)
    Dim hyperlink = DirectCast(cellContent, HyperlinkButton)
    If Binding IsNot Nothing Then
        Dim newBinding As Binding = CopyBinding(Binding)
        newBinding.Source = row.DataItem
        hyperlink.SetBinding(HyperlinkButton.NavigateUriProperty, newBinding)
    End If
    hyperlink.HorizontalAlignment = HorizontalAlignment
    hyperlink.VerticalAlignment = VerticalAlignment
End Sub
```

C#	Copy Code

```
public override void BindCellContent(FrameworkElement cellContent,
DataGridRow row)
{
    var hyperlink = (HyperlinkButton)cellContent;
    if (Binding != null)
    {
        Binding newBinding = CopyBinding(Binding);
        newBinding.Source = row.DataItem;
        hyperlink.SetBinding(HyperlinkButton.NavigateUriProperty,
newBinding);
    }
    hyperlink.HorizontalAlignment = HorizontalAlignment;
    hyperlink.VerticalAlignment = VerticalAlignment;
}
```

Note that you can also set the data item as the data context of the hyperlink instead of setting it in the Source property of the binding. For example:

Visual Basic	Copy Code

```
Hyperlink.DataContext = row.DataItem
```

C#	Copy Code

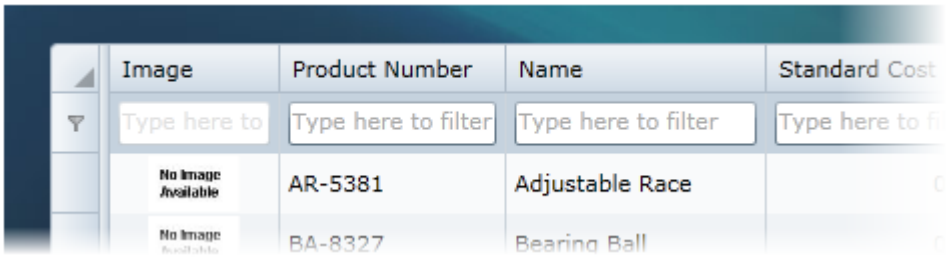
```
Hyperlink.DataContext = row.DataItem;
```

Although you will end up with the same result, this technique does not perform as well as setting the binding source property directly.

Custom Rows

Customizing Row Cell Content

This topic explains how to customize cell content. For example, suppose you wanted to build a filter row. You could create a grid where the first row has a TextBox in each cell and when you type on it the grid is filtered by the typed text as in the following image:



Adding a Class File

You would need to add a new class file where the custom row will be written. For example, complete the following steps to add a new class file:

1. Navigate to the Solution Explorer, right-click the project name and select Add | New Item.
2. In the Add New Item dialog box choose Class in the list of available templates.
3. Name the class, for example "DataGridFilterRow", and click the Add button to add the class to the project.
4. Update the class so it appears similar to the following:

Visual Basic	Copy Code

```
Imports C1.WPF.DataGrid
Public Class DataGridFilterRow
   Inherits DataGridRow
End Class
```

C#	Copy Code

```
using C1.WPF.DataGrid;
public class DataGridFilterRow : DataGridRow
{

}
```

This will update the class to inherit from DataGridRow. Once the file is created it must inherit from DataGridRow.

Once you've added the class, you can use it to implement filtering in the grid.

Overriding Methods

The methods you would need to override to specify the cell content of custom row are very similar to those exposed in custom columns. To implement custom cell content you'd need to override the following methods:

- HasCellPresenter: Determines whether a cell should exist for this row and the specified column.
- GetCellContentRecyclingKey: Key used to store the cell content for future reuse in a shared pool. Rows returning the same RecyclingKey can share the same cell content instances.
- CreateCellContent: Creates a visual element that will be used to display information inside a cell in this column.
- BindCellContent: Initializes the cell content presenter.
- UnbindCellContent: This method is called before the cell content is recycled.

In the filter row the HasCellPresenter method will return always true, because all columns will have a corresponding cell. In other scenarios like a summary row, only the columns where there is an aggregate function will have a cell.

The GetCellContentRecyclingKey method will return typeof(TextBox), which allows recycling the text boxes, and the CreateCellContent will create a new instance of it. Add the following code:

Visual Basic	Copy Code

```
Protected Overrides Function GetCellContentRecyclingKey(column As
DataGridColumn) As Object
       Return GetType(TextBox)
End Function

Protected Overrides Function CreateCellContent(column As DataGridColumn) As
FrameworkElement
       Return New TextBox()
End Function
```

C#	Copy Code

```
protected override object GetCellContentRecyclingKey(DataGridColumn column)
{
    return typeof(TextBox);
}

protected override FrameworkElement CreateCellContent(DataGridColumn column)
{
```

```
    return new TextBox();
}
```

Implementing Filtering

In the previous steps you added a TextBox in each cell, but these controls currently do not do anything; to implement filtering complete the following steps:

1. Add the following code to the BindCellContent method:

Visual Basic	Copy Code

```
Protected Overrides Sub BindCellContent(cellContent As FrameworkElement,
column As DataGridColumn)
   Dim filterTextBox = DirectCast(cellContent, TextBox)
   'If the column doesn't have a FilterMemberPath specified
   'it won't allow entering text in the TextBox;
   If String.IsNullOrEmpty(column.FilterMemberPath) Then
          filterTextBox.IsEnabled = False
          filterTextBox.Text = "Not available"
   Else
          filterTextBox.Text = ""
          filterTextBox.IsEnabled = True
   End If
   ' Handle TextChanged to apply the filter to the column.
   filterTextBox.TextChanged += New EventHandler(Of
TextChangedEventArgs)(filterTextBox_TextChanged)
End Sub
```

C#	Copy Code

```
protected override void BindCellContent(FrameworkElement cellContent,
DataGridColumn column)
{
    var filterTextBox = (TextBox)cellContent;
    //If the column doesn't have a FilterMemberPath specified
    //it won't allow entering text in the TextBox;
    if (string.IsNullOrEmpty(column.FilterMemberPath))
    {
        filterTextBox.IsEnabled = false;
```

```
        filterTextBox.Text = "Not available";
    }
    else
    {
        filterTextBox.Text = "";
        filterTextBox.IsEnabled = true;
    }
    // Handle TextChanged to apply the filter to the column.
    filterTextBox.TextChanged += new
EventHandler<TextChangedEventArgs>(filterTextBox_TextChanged);
}
```

2. In UnbindCellContent you must remove the text changed handler to avoid leaking memory:

Visual Basic	Copy Code

```
Protected Overrides Sub UnbindCellContent(cellContent As FrameworkElement,
column As DataGridColumn)
   Dim filterTextBox = DirectCast(cellContent, C1SearchBox)
   filterTextBox.TextChanged -= New EventHandler(Of
TextChangedEventArgs)(filterTextBox_TextChanged)
End Sub
```

C#	Copy Code

```
protected override void UnbindCellContent(FrameworkElement cellContent,
DataGridColumn column)
{
    var filterTextBox = (C1SearchBox)cellContent;
    filterTextBox.TextChanged -= new
EventHandler<TextChangedEventArgs>(filterTextBox_TextChanged);
}
```

3.

Adding a Custom Row

You can replace rows the data grid uses to show the data of each data item or group with custom rows, or you can add custom rows on top or bottom of data item rows.

Replacing Data Item Row

In order to replace the rows generated by the data grid you must add a handler to the **CreatingRow** event.

The following code replaces the default row with a template row:

Visual Basic	Copy Code

```
Private Sub C1DataGrid_CreatingRow(sender As Object, e As
DataGridCreatingRowEventArgs)
       'Check if it's an item row (it could be a group row too).
       If e.Type = DataGridRowType.Item Then
             e.Row = New DataGridTemplateRow() With { _
                    .RowTemplate = DirectCast(Resources("TemplateRow"),
DataTemplate) _
             }
       End If
End Sub
```

C#	Copy Code

```
private void C1DataGrid_CreatingRow(object sender,
DataGridCreatingRowEventArgs e)
{
    //Check if it's an item row (it could be a group row too).
    if (e.Type == DataGridRowType.Item)
    {
        e.Row = new DataGridTemplateRow()
        {
            RowTemplate = (DataTemplate)Resources["TemplateRow"]
        };
    }
}
```

Adding an Extra Row

DataGrid for WPF allows adding one or more rows on top or bottom of data. This functionality is used in the new row, total row, summary row, and filter row scenarios.

For example, in XAML or code:

XAML	Copy Code

```
<c1:C1DataGrid>
    <c1:C1DataGrid.TopRows>
        < local:DataGridFilterRow />
    </c1:C1DataGrid.TopRows>
    <c1:C1DataGrid.BottomRows>
        < local:DataGridFilterRow/>
    </c1:C1DataGrid.BottomRows>
</c1:C1DataGrid>
```

Visual Basic	Copy Code

```
grid.Rows.TopRows.Add(New DataGridFilterRow())
```

C#	Copy Code

```
grid.Rows.TopRows.Add(new DataGridFilterRow());
```

Adding Row Details

Each grid row in **DataGrid for WPF** can be expanded to display a row details section. This row details section can display more details information about a specific row's content. The row details section is defined by a **DataTemplate**, **RowDetailsTemplate** that specifies the appearance of the section and the data to be displayed. For an example, see the RowDetailsTemplate topic.

Using the **RowDetailsVisibilityMode** property the row details section can be displayed for selected rows, displayed for all rows, or it can be collapsed. See Setting Row Details Visibility for more information.

Data Binding

The C1DataGrid control can be bound to any object that implements the System.Collections.IEnumerable interface (such as XmlDataProvider, ObjectDataProvider, DataSet, DataView, and so on). You can use the C1DataGrid.ItemsSource property to bind the C1DataGrid.

To bind the grid, simply set the ItemsSource property to an IEnumerable implementation. Each row in the data grid will be bound to an object in the data source, and each column in the data grid will be bound to a property of the data object.

Note that in order for the C1DataGrid user interface to update automatically when items are added to or removed from the source data, the control must be bound to a collection that implements INotifyCollectionChanged, such as an ObservableCollection<(Of <(T>)>).

For steps on binding a C1DataGrid control to an XML data source, see the DataGrid for WPF Quick Start.

Deferred Scrolling

DataGrid for WPF and Silverlight supports both real time and deferred scrolling. By default, real time scrolling is used and as a user moves the thumb button or clicks the scroll button the grid scrolls. In deferred scrolling, the grid is not scrolled until the user releases the scrollbar thumb; the grid does not move as the scrollbar thumb is moved. You might want to implement deferred scrolling in your application if the grid contains a large amount of data or to optimize scrolling.

You can determine how the grid is scrolled by setting the ScrollMode property. You can set the **ScrollMode** property to a C1DataGridScrollMode enumeration option, either **RealTime** (default) or **Deferred**. The example below set the grid to deferred scrolling mode.

In XAML

To set the grid to deferred scrolling mode, add ScrollMode="Deferred" to the <c1:C1DataGrid> tag so that it appears similar to the following:

<c1:C1DataGrid x:Name="c1DataGrid1" ScrollMode="Deferred">

In Code

To set the grid to deferred scrolling mode, set the **ScrollMode** property to **Deferred**. For example:

Visual Basic	Copy Code

```
Me.C1DataGrid1.ScrollMode = C1DataGridScrollMode.Deferred
```

C#	Copy Code

```
this.c1DataGrid1.ScrollMode = C1DataGridScrollMode.Deferred;
```

Defining Columns

You can use DataGrid for WPF and Silverlight's Columns collection to programmatically add, insert, remove, and change any columns in the control at run time. You can also specify columns in XAML with or without automatically generating columns.

Creating your own columns enables you to use additional column types, such as the DataGridTemplateColumn type or custom column types. The DataGridTemplateColumn type provides an easy way to create a simple custom column. The CellTemplate and CellEditingTemplate properties enable you to specify content templates for both display and editing modes.

See Also

Generating Columns

Generating Columns

By default, the **C1DataGrid** control generates columns automatically, based on the type of data, when you set the **ItemsSource** property. The generated columns are of type **DataGridCheckBoxColumn** for bound Boolean (and nullable Boolean) properties, and of type **DataGridTextColumn** for bound string data, **DataGridComboBoxColumn** for bound enum data, **DataGridDateTimeColumn** for bound date/time data, and **DataGridNumericColumn** for bound numeric data. Bound undefined data is displayed in a **DataGridBoundColumn** type column. If a property does not have a String or numeric value type, the generated text box columns are read-only and display the data object's **ToString** value.

You can prevent automatic column generation by setting the **AutoGenerateColumns** property to **False**. This is useful if you want to create and configure all columns explicitly. Alternatively, you can let the data grid generate columns, but handle the **AutoGeneratingColumn** event to customize columns after creation. To rearrange the display order of the columns, you can set the **DisplayIndex** property for individual columns.

Editing

The following topics describe how to use **C1DataGrid**'s editing features.

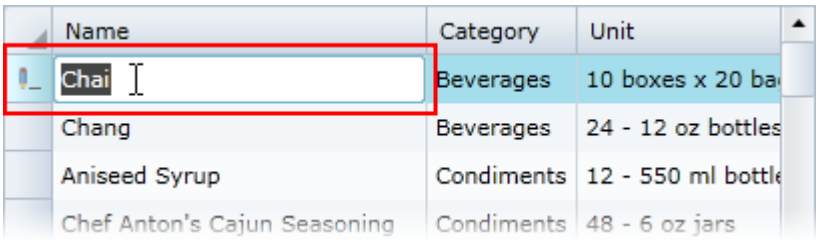
See Also

Disabling Cell Editing

Editing Cells

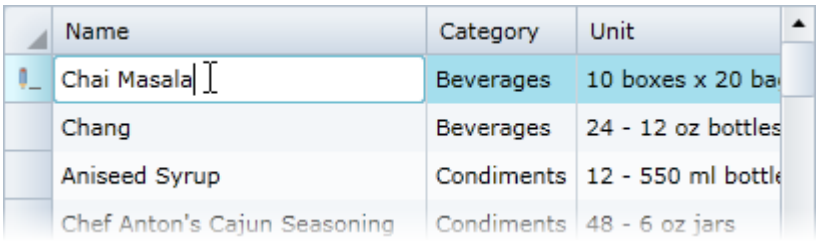
Users can easily edit cell content at run time. Editing content is as simple as selecting a cell and deleting or changing the content in that cell. Complete the following steps to edit cell content:

1. Double-click the cell you would like to edit.

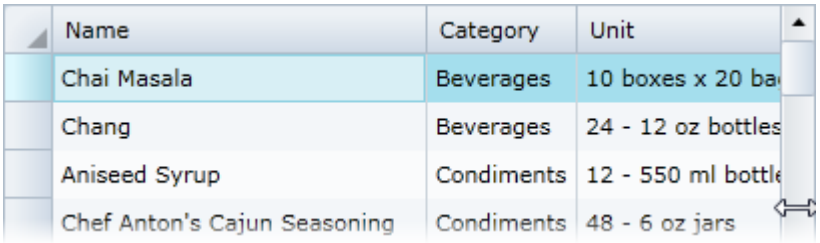


A cursor will appear in that cell indicating that it can be edited and a pencil icon will appear in the row indicator column, indicating that a cell in that row is in edit mode.

1. Delete text or type in new or additional text to edit the content of the cell:



1. Press ENTER or click away from the cell you are editing for the changes you made to take effect:



The pencil icon indicating editing will no longer be visible.

Note that the **CanUserEditRows** property must be set to **True** (default) for editing to be possible. See **Disabling Cell Editing** for an example.

Disabling Cell Editing

By default end users edit content in the grid at run time. For more information, see Editing Cells. If you choose, however, you can disable the cell editing feature by setting the **C1DataGrid.CanUserEditRows** property to **False**.

At Design Time

To disable cell editing, complete the following steps:

1. Click the **C1DataGrid** control once to select it.

2. Navigate to the Properties window and locate the **CanUserEditRows** property.
3. Clear the check box next to the **CanUserEditRows** property.

In XAML

For example to disable cell editing, add CanUserEditRows="False" to the <c1:C1DataGrid> tag so that it appears similar to the following:

```
<c1:C1DataGrid Name="c1datagrid1" Height="180" Width="250" CanUserEditRows="False" />
```

In Code

For example, to disable cell editing, add the following code to your project:

Visual Basic	Copy Code

```
Me.C1DataGrid1.CanUserEditRows = False
```

C#	Copy Code

```
this.c1DataGrid1.CanUserEditRows = false;
```

What You've Accomplished

Run the application and double-click a cell; observe that the cell does not move into edit mode and you can no longer edit grid content at run time. For more information about cell editing, see the **Editing Cells** topic.

Locking the Grid

By default users can interact and edit the grid and columns in the grid. If you choose, you can set the grid or specific columns in the grid to not be editable with the **IsReadOnly** property.

In XAML

To lock the grid from being edited, add IsReadOnly="True" to the <c1:C1DataGrid> tag so that it appears similar to the following:

```
<c1:C1DataGrid x:Name="C1DataGrid1" IsReadOnly="True">
```

In Code

To lock the grid from editing, set the **IsReadOnly** property to **True**. For example:

Visual Basic	Copy Code
`Me.C1DataGrid1.IsReadOnly = True`	

C#	Copy Code
`this.c1DataGrid1.IsReadOnly = true;`	

Filtering

DataGrid for WPF and Silverlight includes several options for filtering the grid. You can add column filtering, a filter row, or full-text grid filtering. There's basic filtering or you can use the **C1.WPF.DataGrid.Filters.dll** assembly which offers more advanced filtering options than are built into the grid. How you choose to filter the grid will depends on your needs – for example if you just want the end user to be able to filter text in a column or if your application requires more advanced custom filtering.

Disabling Column Filtering

Tab Filter List

Basic Column Filtering

For basic column filtering, simply set the CanUserFilter property to **True**. This will add a filter column element to the grid's user interface allowing end users to filter the grid via a drop-down box in each column's header.

By default the **CanUserFilter** property will be set to **True** and filtering will be enabled. If you need to manually enable basic filtering, you can use the following markup or code:

XAML	Copy Code

```
<c1:C1DataGrid Name="c1datagrid1" Height="180" Width="250"
CanUserFilter="True" />
```

Visual Basic	Copy Code

```
Me.C1DataGrid1.CanUserFilter = True
```

C#	Copy Code

```
this.c1DataGrid1.CanUserFilter = true;
```

See the Filtering Columns topic for more details and examples.

Filtering Columns

DataGrid for WPF incorporates a filter column element in the user interface, allowing users to filter columns by specific criteria at run time.

To filter a column's text at run time, complete the following steps:

1. Click the drop-down arrow in a text column's header:

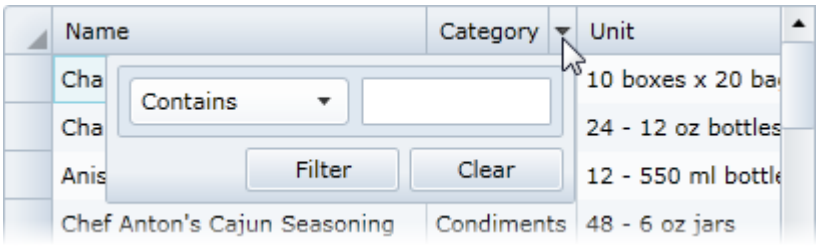
2. Enter the text in the filter text box that you want the column to be filtered by, and click the **Filter** button.

The column will be sorted.

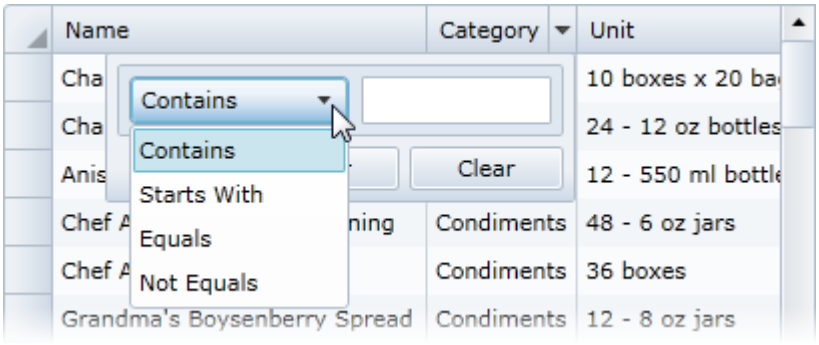
Filter options vary depending on the column type. The following filter options may be included:

- **Text Columns**

In text columns, the filter bar appears similar to the following:

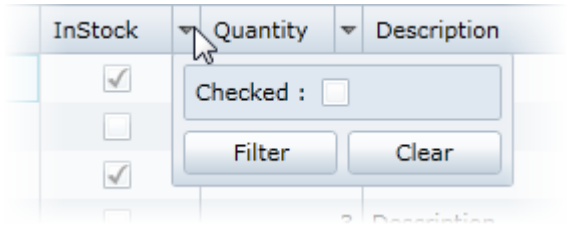


You can filter the column by whether items in the column contain, start, are equivalent to, or are not equivalent to the filter condition:



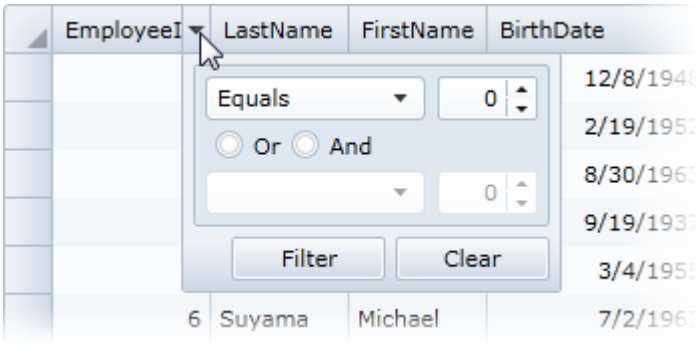
- **Boolean Columns**

Boolean check box columns can be filtered by whether items in the column are checked or not:

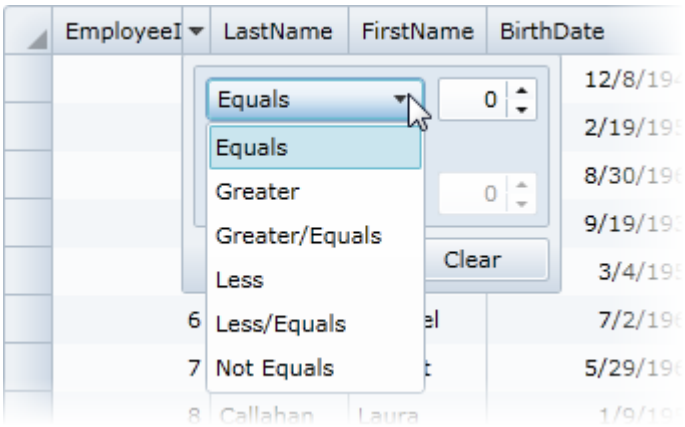


- **Numeric Columns**

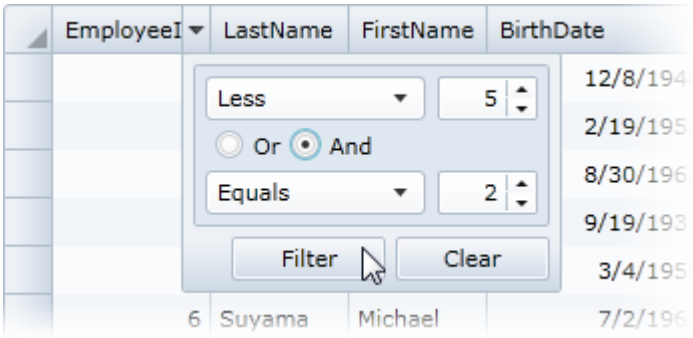
Numeric columns offer several options for filtering:



You can filter the column by specific condition:



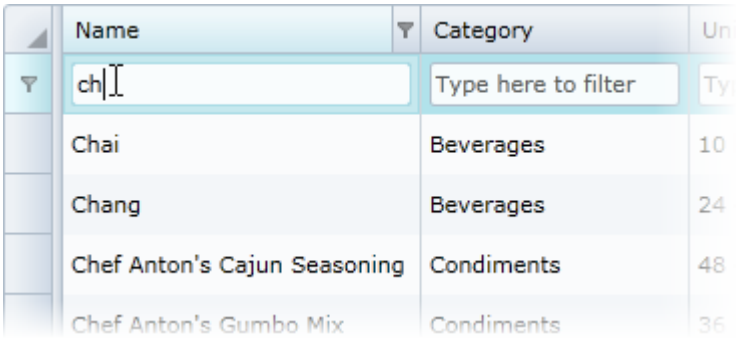
And you can use the **And** and **Or** radio buttons to filter by multiple conditions:



Note: The **CanUserFilter** property must be set to **True** (default) for filtering to be possible.

Filter Row Filtering

If you choose, you can add a visible filter row column to the top or bottom of your grid. The filter row column appears as a row consisting of text boxes in each cell. When text is entered in a text box, the text of the column and grid is filtered by that text as it is entered:



For example, the following markup adds two filter rows, one at the top and one at the bottom of the grid:

XAML	Copy Code

```
<c1:C1DataGrid x:Name="grid" Grid.Row="1" CanUserAddRows="False"
CanUserFreezeColumns="True" FrozenTopRowsCount="1" FrozenBottomRowsCount="1"
RowHeight="30" >
    <c1:C1DataGrid.TopRows>
        < c1:DataGridFilterRow />
    </c1:C1DataGrid.TopRows>
    <c1:C1DataGrid.BottomRows>
        < c1:DataGridFilterRow/>
    </c1:C1DataGrid.BottomRows>
</c1:C1DataGrid>
```

You can see the **C1DataGrid_Demo2010/Filtering/FilterRow/FilterRow.xaml** sample for an example.

Full Text Grid Filtering

C1DataGrid also supports full text filtering for the entire grid. Setting an attached property to the data grid allows the end user to filter the whole data grid (all the columns at once) by text entered in an external text box. All the matching results in the grid will be highlighted as the user types.

To use this method of grid filtering, you would need to add a text box control to your application and reference that control in the **FullTextSearchBehavior** attached property. For example, with the following XAML markup:

XAML	Copy Code

```
<StackPanel>
    <c1:C1TextBoxBase x:Name="filterTextBox" Width="200" Watermark = "Type
here to filter text"/>
    <c1:C1DataGrid x:Name="c1dg" c1:C1NagScreen.Nag="True">
    < c1:C1FullTextSearchBehavior.FullTextSearchBehavior>
        < c1:C1FullTextSearchBehavior Filter="{Binding
ElementName=filterTextBox,Path=C1Text}"/>
    < /c1:C1FullTextSearchBehavior.FullTextSearchBehavior>
</c1:C1DataGrid>
</StackPanel>
```

You can see the **C1DataGrid_Demo2010/Filtering/OneTextBoxFilter/OneTextBoxFilter.xaml** sample for an example.

Advanced Filtering

One was to add advanced filtering is by using C1AdvancedFiltersBehavior. **C1AdvancedFiltersBehavior** adds a range of advanced filters to the C1DataGrid built-in columns. For example, this behavior adds several predefined filters, expanding the options for each column:

XAML	Copy Code

```
<c1:C1DataGrid>
    < c1:C1AdvancedFiltersBehavior.AdvancedFiltersBehavior>
        < c1:C1AdvancedFiltersBehavior/>
    < /c1:C1AdvancedFiltersBehavior.AdvancedFiltersBehavior>
</c1:C1DataGrid>
```

Column Filter List

An option for filtering the grid is to add a list of filters to a column in XAML. For example, the following markup adds three filters in a numeric column including a custom filter called **RangeFilter**:

XAML	Copy Code

```
<c1:DataGridNumericColumn Header="Range filter" Binding="{Binding
StandardCost}" FilterMemberPath="StandardCost">
    < c1:DataGridNumericColumn.Filter>
        < c1:DataGridContentFilter>
            < c1:DataGridFilterList>
                <local:DataGridRangeFilter Minimum="0" Maximum="1000"/>
                < c1:DataGridNumericFilter/>
                < c1:DataGridTextFilter/>
            < /c1:DataGridFilterList>
        < /c1:DataGridContentFilter>
    < /c1:DataGridNumericColumn.Filter>
</c1:DataGridNumericColumn>
```

You can to refer to pre-installed product samples through the following path:

Documents | ComponentOne Samples | Silverlight

Disabling Column Filtering

By default end users can filter columns in the grid at run time. For more information, see Filtering Columns. If you choose, however, you can disable the column filtering feature by setting the C1DataGrid.CanUserFilter property to **False**.

At Design Time

To disable column filtering, complete the following steps:

1. Click the C1DataGrid control once to select it.
2. Navigate to the Properties window and locate the **CanUserFilter** property.
3. Clear the check box next to the **CanUserFilter** property.

In XAML

For example to disable column filtering, add CanUserFilter="False" to the <c1:C1DataGrid> tag so that it appears similar to the following:

```
<c1:C1DataGrid Name="c1datagrid1" Height="180" Width="250" CanUserFilter="False" />
```

In Code

For example, to disable column filtering, add the following code to your project:

Visual Basic	Copy Code

```
Me.C1DataGrid1.CanUserFilter = False
```

C#	Copy Code

```
this.c1DataGrid1.CanUserFilter = false;
```

What You've Accomplished

Run the application and observe that you can no longer filter columns at run time; the drop-down arrow to display the filter box is no longer visible at run time. For more information about column filtering, see the Filtering Columns topic.

Tab Filter List

An option for filtering the grid is to add a list of filters displayed in a tab control:

XAML	Copy Code

```
<c1:DataGridNumericColumn Header="Filters inside a tab control"
```

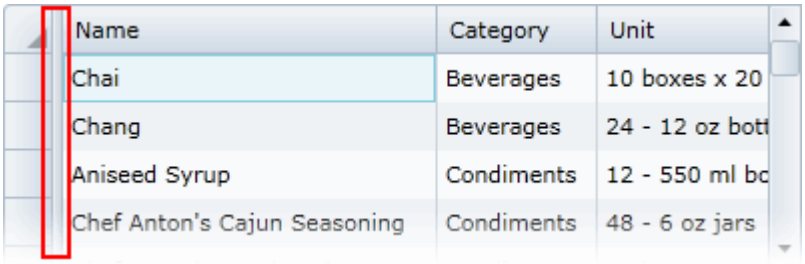
```
Binding="{Binding StandardCost}" FilterMemberPath="StandardCost">
    < c1:DataGridNumericColumn.Filter>
        < c1:DataGridContentFilter>
            < local:DataGridTabFilters Width="250">
                < local:DataGridRangeFilter Minimum="0" Maximum="1000"/>
                < c1:DataGridNumericFilter/>
                < c1:DataGridTextFilter/>
            < /local:DataGridTabFilters>
        < /c1:DataGridContentFilter>
    < /c1:DataGridNumericColumn.Filter>
</c1:DataGridNumericColumn>
```

You can refer to pre-installed product samples through the following path:

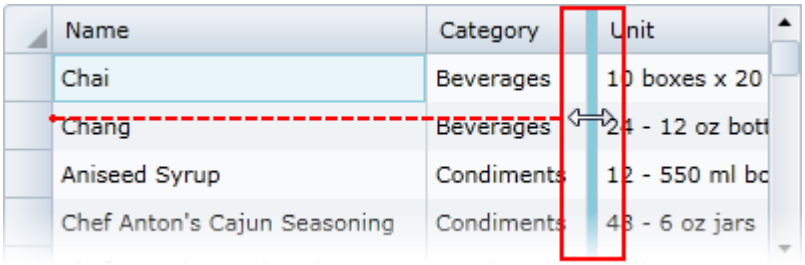
Documents | ComponentOne Samples | Silverlight

Freezing

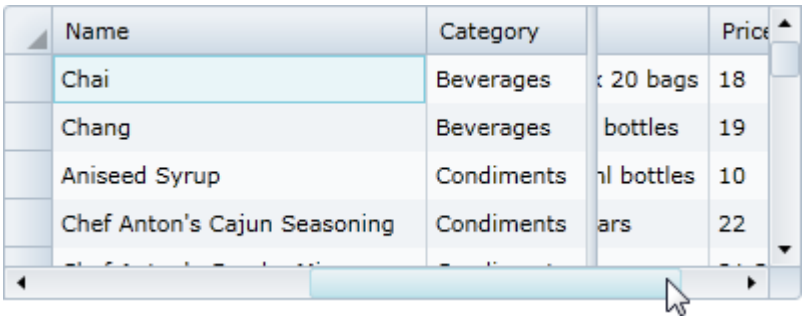
Users can freeze columns at run time to prevent them from being scrolled horizontally. This is useful as it keeps specific columns visible when the grid is resized or scrolled. The freeze bar enables users to freeze columns. When visible, the freeze bar appears to the left of the first columns by default:



To freeze specific columns, move the freeze bar to the right of the column(s) you want to freeze. For example, in the following image the freeze bar was moved to the right of the second columns:



Once columns are frozen, they are not scrolled when the grid is scrolled horizontally. For example, in the following image the first two columns are frozen:



Note that the **ShowVerticalFreezingSeparator** property must be set to **Left** (by default **None**) for the freeze bar to be visible and the **CanUserFreezeColumns** property must be set to **Left** (by default **None**) to allow users to freeze columns are run time. See Enabling Column Freezing for an example.

See Also

Enabling Column Freezing

Freezing Grid Rows

Enabling Column Freezing

You may want to freeze columns in the grid at run time so that they are always visible even when the grid is scrolled horizontally. For more information, see Freezing Columns. This feature is not enabled by default, but if you choose you can enable the column freezing feature by setting the CanUserFreezeColumns property to **Left**.

At Design Time

To enable column freezing, complete the following steps:

1. Click the C1DataGrid control once to select it.
2. Navigate to the Properties window and locate the **CanUserFreezeColumns** property.
3. Click the drop-down arrow next to the **CanUserFreezeColumns** property and select Left.

In XAML

For example to enable column freezing, add CanUserFreezeColumns="Left" to the <c1:C1DataGrid> tag so that it appears similar to the following:

```
<c1:C1DataGrid Name="c1datagrid1" Height="180" Width="250"
CanUserFreezeColumns="Left" />
```

In Code

For example, to enable column freezing, add the following code to your project:

Visual Basic	Copy Code

```
Me.C1DataGrid1.CanUserFreezeColumns = DataGridColumnFreezing.Left
```

C#	Copy Code

```
this.c1DataGrid1.CanUserFreezeColumns = DataGridColumnFreezing.Left;
```

What You've Accomplished

Run the application and observe that the freeze bar is visible at run time. The freeze bar can be moved to select which columns to freeze; columns to the left of the bar will be frozen so that they are always visible even when the grid is scrolled horizontally. For more information about column freezing, see the Freezing Columns topic.

Freezing Grid Rows

You may want to freeze the top or bottom rows in the grid at so that they are always visible even when the grid is scrolled vertically at run time. This feature is not enabled by default, but if you choose you can enable the row freezing feature by setting the FrozenTopRowsCount and FrozenBottomRowsCount properties.

At Design Time

To freeze the top and bottom two rows, complete the following steps:

1. Click the C1DataGrid control once to select it and navigate to the Properties window.
2. In the Properties window, locate the **FrozenTopRowsCount** property, click in the text box next to the property, and enter "2" to set the number of top tows that will be frozen.
3. Locate the **FrozenBottomRowsCount** property, click in the text box next to the property, and enter "2" to set the number of bottom rows that will be frozen.

In XAML

For example to freeze the top and bottom two rows, add FrozenTopRowsCount="2" FrozenBottomRowsCount="2" to the <c1:C1DataGrid> tag so that it appears similar to the following:

<c1:C1DataGrid Name="c1datagrid1" Height="180" Width="250" FrozenTopRowsCount="2" FrozenBottomRowsCount="2" />

In Code

For example, to freeze the top and bottom two rows, add the following code to your project:

Visual Basic	Copy Code

```
Me.C1DataGrid1.FrozenTopRowsCount = True
Me.C1DataGrid1.FrozenBottomRowsCount = True
```

C#	Copy Code

```
this.c1DataGrid1.FrozenTopRowsCount = true;
this.c1DataGrid1.FrozenBottomRowsCount = true;
```

What You've Accomplished

Run the application and observe that the two top and bottom rows are frozen. Scroll the grid vertically and notice that the top two an bottom two rows do not scroll and are locked in place. By default the **Add New** row appears as the last row in the grid and so will be one of the frozen rows.

Grouping

You can enable grouping and the grouping area of the grid so that users can group columns in your grid at run time to better organize information. For more information, see Grouping Columns. By default, user cannot group columns in the grid but you can enable this function by setting the **C1DataGrid.CanUserGroup** property to **True**.

At Design Time

To enable grouping, complete the following steps:

1. Click the **C1DataGrid** control once to select it.
2. Navigate to the Properties window and locate the **CanUserGroup** property.
3. Check the check box next to the **CanUserGroup** property.

In XAML

For example to enable grouping, add CanUserGroup="True" to the < c1:C1DataGrid> tag so that it appears similar to the following:

```
<c1:C1DataGrid Name="c1datagrid1" Height="180" Width="250" CanUserGroup=True" />
```

In Code

For example, to enable grouping, add the following code to your project:

Visual Basic	Copy Code

```
Me.C1DataGrid1.CanUserGroup = True
```

C#

Copy Code

```
this.c1DataGrid1.CanUserGroup = true;
```

What You've Accomplished

Run the application and notice that the grouping area appears at the top of the grid. Note that you can also customize the visibility of the grouping area. For more information about the grouping area, see the Showing the Grouping Area topic.

See Also

Showing the Grouping Area

Group Summaries

Showing the Grouping Area

By default grouping in the grid is disabled and the grouping area is not visible. For more information, see Grouping Columns. When the CanUserGroup property is set to **True** and grouping is enabled the grouping area is made visible. But if you choose you can show or hide the grouping area whether or not grouping is enabled. By default, the grouping area is not visible when grouping is not enabled but you can make the area visible by setting the ShowGroupingPanel property to **True**.

At Design Time

To show the grouping area, complete the following steps:

1. Click the C1DataGrid control once to select it.
2. Navigate to the Properties window and locate the **ShowGroupingPanel** property.
3. Check the check box next to the **ShowGroupingPanel** property.

In XAML

For example to show the grouping area, add ShowGroupingPanel="True" to the <c1:C1DataGrid> tag so that it appears similar to the following:

```
<c1:C1DataGrid Name="c1DataGrid1" Height="180" Width="250" ShowGroupingPanel="True" />
```

In Code

For example, to show the grouping area, add the following code to your project:

Visual Basic	Copy Code
`Me.C1DataGrid1.ShowGroupingPanel = True`	

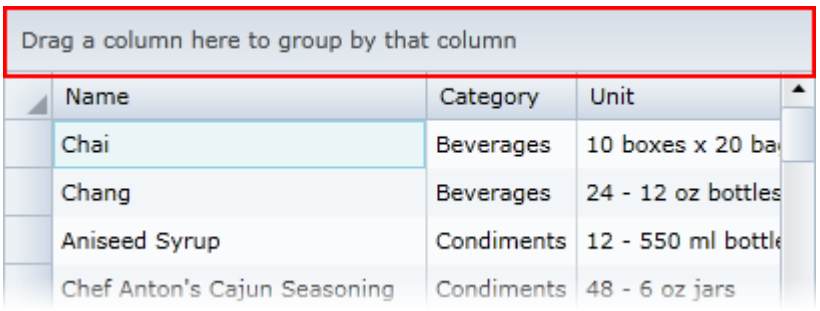
C#	Copy Code
`this.c1DataGrid1.ShowGroupingPanel = true;`	

What You've Accomplished

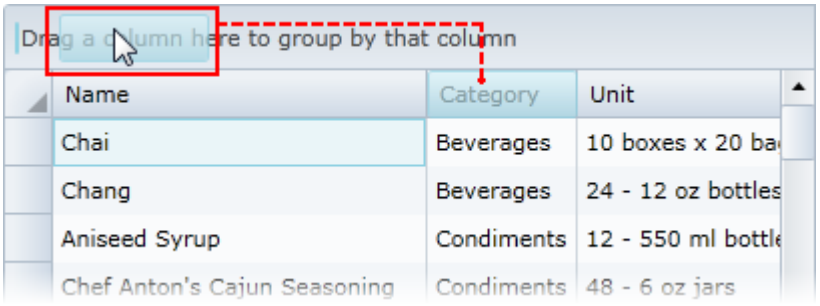
Run the application and notice that the grouping area appears at the top of the grid. Note that even if the grouping area is visible, grouping will not be enabled if the **CanUserGroup** property is **False**. For more information, see the Enabling Grouping in the Grid topic.

Grouping Columns

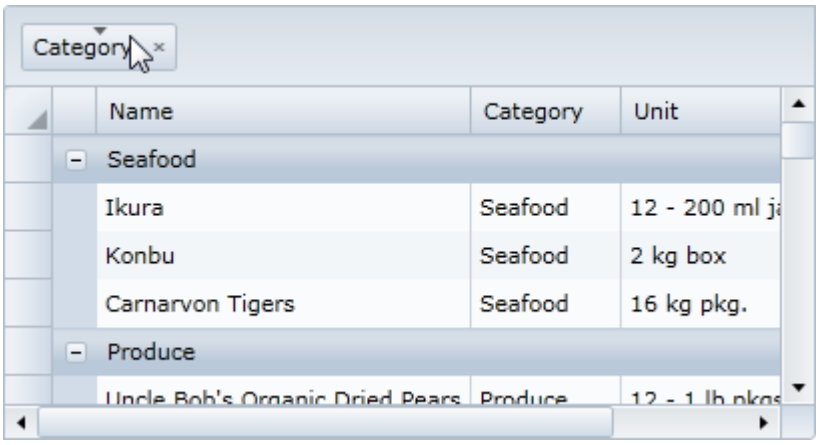
Users can group columns in your grid at run time to better organize information. The grouping area at the top of the grid allows you to easily group columns through a simple drag-and-drop operation:



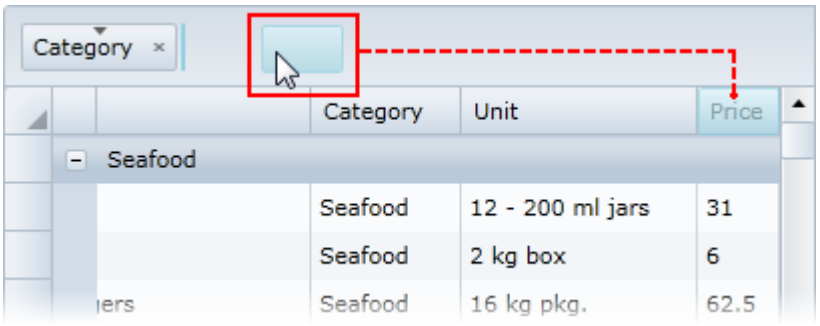
To group a column, drag a column header onto the grouping area:



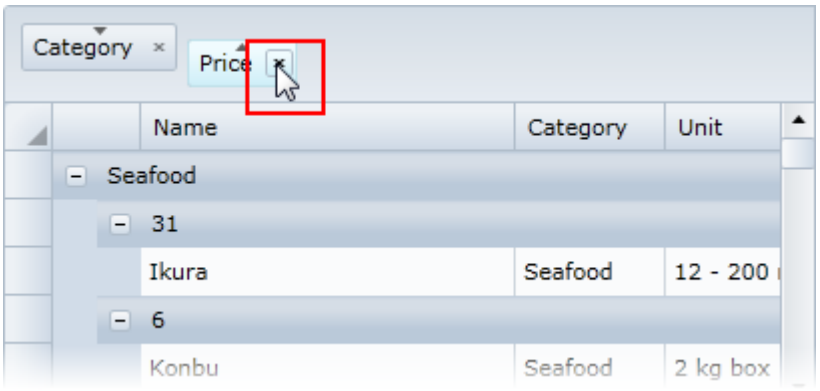
You can sort the display of grouped items, by clicking the column header in the grouping area. In the following image the grouped column has been reverse sorted:



You can group multiple columns by performing a drag-and-drop operation to drag additional columns to the grouping area:



To remove the grouping, simply click the **X** button next to a grouped column in the grouping area of the grid:



Note that the **CanUserGroup** property must be set to **True** for the grouping area to be visible and grouping to be possible (by default it is set to **False**). For more information, see Enabling Grouping in the Grid. For more information about showing the grouping area, see the **Showing the Grouping Area** topic.

Group Summaries

DataGrid for WPF includes the C1.WPF.DataGrid.Summaries.dll assembly which can enhance the grid by adding a summary row.

The Summaries assembly contains the following features:

- SummaryRow: a row that shows the aggregate functions corresponding to each column (See **C1DataGrid_Demo2010/Grouping/GrandTotal.xaml**)
- GroupRowWithSummaries: the same as the previous one but the summaries are shown in the group row rather than a regular row. (See **C1DataGrid_Demo2010/Grouping/Grouping.xaml**)

Keyboard and Mouse Navigation

DataGrid for WPF supports several run-time keyboard and mouse navigation options that provide increased accessibility. The following topics detail some of these end-user interactions.

See Also

Keyboard Navigation

Mouse Navigation

Multiple Row Selection

Custom Keyboard Navigation

Keyboard Navigation

The following table lists several keyboard shortcuts that can be used to navigate and manipulate the grid at run time. Note that on Apple computers, end users should use the Command (or Apple) key in place of the CTRL key:

Key Combination	Description
DOWN Arrow	Moves the focus to the cell directly below the current cell. If the focus is in the last row, pressing the DOWN ARROW does nothing.
UP Arrow	Moves the focus to the cell directly above the current cell. If the focus is in the first row, pressing the UP ARROW does nothing.

LEFT Arrow	Moves the focus to the previous cell in the row. If the focus is in the first cell in the row, pressing the LEFT ARROW does nothing.
RIGHT Arrow	Moves the focus to the next cell in the row. If the focus is in the last cell in the row, pressing the RIGHT ARROW does nothing.
HOME	Moves the focus to the first cell in the current row.
END	Moves the focus to the last cell in the current row.
PAGE DOWN	Scrolls the control downward by the number of rows that are displayed. Moves the focus to the last displayed row without changing columns. If the last row is only partially displayed, scrolls the grid to fully display the last row.
PAGE UP	Scrolls the control upward by the number of rows that are displayed. Moves focus to the first displayed row without changing columns. If the first row is only partially displayed, scrolls the grid to fully display the first row.
TAB	If the current cell is in edit mode, moves the focus to the next editable cell in the current row. If the focus is already in the last cell of the row, commits any changes that were made and moves the focus to the first editable cell in the next row. If the focus is in the last cell in the control, moves the focus to the next control in the tab order of the parent container. If the current cell is not in edit mode, moves the focus to the next control in the tab order of the parent container.
SHIFT+TAB	If the current cell is in edit mode, moves the focus to the previous editable cell in the current row. If the focus is already in the first cell of the row, commits any changes that were made and moves the focus to the last cell in the previous row. If the focus is in the first cell in the control, moves the focus to

	the previous control in the tab order of the parent container. If the current cell is not in edit mode, moves the focus to the previous control in the tab order of the parent container.
CTRL + DOWN ARROW	Moves the focus to the last cell in the current column.
CTRL + UP ARROW	Moves the focust to the last cell in the current column.
CTRL + RIGHT ARROW	Moves the focus to the last cell in the current row.
CTRL + LEFT ARROW	Moves the focus to the first cell in the current row.
CTRL + HOME	Moves the focus to the first cell in the control.
CTRL + PAGE DOWN	Same as PAGE DOWN.
CTRL + PAGE UP	Same as PAGE UP.
ENTER	Enter/exit mode on a selected cell (if the grid and column's **IsReadOnly** properties are **False**).
F2	Enter/exit edit mode on a selected cell (if the grid and column's IsReadOnly properties are False).
ESC	Cancel editing of a cell or new row.
DEL	Delete selected row.
INSERT	Scrolls to the new row and begins editing it.

Mouse Navigation

The following table lists several mouse and keyboard shortcuts that can be used to navigate and manipulate the grid at run time. Note that on Apple computers, end users should use the Command (or Apple) key in place of the CTRL key:

Mouse Action	Description
Click an unselected row	Makes the clicked row the current row.
Click a cell in the current row	Puts the clicked cell into edit mode.
Drag a column header cell	Moves the column so that it can be dropped into a new position (if the **CanUserReorderColumns** property is **True** and the current column's **CanUserRorder** property is **True**).
Drag a column header separator	Resizes the column (if the **CanUserResizeColumns** property is **True** and the **CanUserResize** property is True for the current column).
Click a column header cell	If the property **ColumnHeaderClickAction** is set to **Sort**, when the user clicks the column header it sorts the column (if the **CanUserSortColumns** property is **True** and the **CanUserSort** property is **True** for the current column). Clicking the header of a column that is already sorted will reverse the sort direction of that column. Pressing the CTRL key while clicking multiple column headers will sort by multiple columns in the order clicked. If the property **ColumnHeaderClickAction** is set to **Select** the column will be selected if **SelectionMode** supports column selection.
CTRL + click a row	Modifies a non-contiguous multi-row selection (if **SelectionMode** support multiple rows, cells, or columns).
SHIFT + click a row	Modifies a contiguous multi-row selection (if **SelectionMode** support multiple rows, cells, or columns).

Multiple Row Selection

If the **SelectionMode** property is set to **MultiRow**, the navigation behavior does not change, but navigating with the keyboard and mouse while pressing SHIFT (including CTRL+SHIFT) will

modify a multi-row selection. Before navigation starts, the control marks the current row as an anchor row. When you navigate while pressing SHIFT, the selection includes all rows between the anchor row and the current row.

Selection Keys

The following selection keys modify multi-row selection:

- SHIFT+DOWN ARROW
- SHIFT+UP ARROW
- SHIFT+PAGE DOWN
- SHIFT+PAGE UP
- CTRL+SHIFT+DOWN ARROW
- CTRL+SHIFT+UP ARROW
- CTRL+SHIFT+PAGE DOWN
- CTRL+SHIFT+PAGE UP

Mouse Selection

If the **SelectionMode** property is set to **MultiRow**, clicking a row while pressing CTRL or SHIFT will modify a multi-row selection.

When you click a row while pressing SHIFT, the selection includes all rows between the current row and an anchor row located at the position of the current row before the first click. Subsequent clicks while pressing SHIFT changes the current row, but not the anchor row.

If the CTRL key is pressed when navigating, the arrow keys will navigate to the border cells; for example, if you are in the first row and you press CTRL + DOWN you will navigate to the last row, if the SHIFT key is pressed, all the rows will be selected though.

Custom Keyboard Navigation

You can add your own custom navigation to the **C1DataGrid** control. Custom keyboard navigation enables you to control how users interact with the grid. For example, you can prevent users from navigating to read-only columns or cells with null values. In a hierarchical grid, you could set up navigation between parent and child grids. To add custom keyboard navigation you would need to handle the **KeyDown** event and then add code to override the default navigation with your customized navigation.

Adding the KeyDown Event Handler

Complete the following steps to add the **KeyDown** event handler:

1. Switch to Code view and add an event handler for the KeyDown event, for example:
2. Switch to Source view and add the event handler to instances of the C1DataGrid control, for example:

<c1:C1DataGrid x:Name="c1DataGrid1" AutoGenerateColumns="True" **KeyDown="c1DataGrid1_KeyDown"**></c1:C1DataGrid>

You can now add code to the **KeyDown** event handler to customize the default navigation. For an example, you can take a look at the hierarchical grid example (**C1_MDSL_RowDetail**) in the **ControlExplorer** sample.

Localizing the Application

You can localize (translate) end user visible strings in **DataGrid for WPF**. Localization in **DataGrid for WPF** is based on the same approach as the standard localization of .NET WinForms applications.

To localize your application, you will need to complete the following steps:

1. Add resource files for each culture that you wish to support. See Adding Resource Files.
2. Update your project file's supported cultures. See Adding Supported Cultures.
3. And, depending on your project, set the current culture. See Setting the Current Culture.

The following topics describe localizing the grid in more detail.

Adding Resource Files

As with Windows Forms, you can create a set of resource files for the **DataGrid for WPF** assembly. You can create separate resource files, with the extension .resx, for each required culture. When the application runs you can switch between those resources and between languages. Note that all parts of your application using components from a **DataGrid for WPF** DLL must use the same localization resource.

Localization Conventions

To localize the grid you would need to set up resource files for each localized culture. The following conventions are recommended when creating .resx resource files:

All .resx files should be placed in the **Resources** subfolder of your project.

Files should be named as follows:

XXX.YYY.resx, where:

- XXX is the name of the ComponentOne assembly.
- YYY is the culture code of the resource. If your translation is only for the invariant culture, the .resx file does not need to contain a culture suffix.

For example:

- C1.WPF.DataGrid.de.resx – German (de) resource for the C1.WPF.DataGrid assembly.
- C1.WPF.DataGrid.resx – Invariant culture resource for the C1.WPF.DataGrid assembly.

Localization Strings

The following table lists strings that can be added to an .resx file to localize your application:

String	Default Value	Description
AddNewRow	Click here to add a new row	Text that appears in the add new row.
CheckBoxFilter_Checked	Checked	Text that appears in the filter for check box columns to indicate if the column should be filtered for checked and unchecked items.
ComboBoxFilter_S electAll	Select All	Text that appears in the filter for check box columns to select all items.
DateTimeFilter_End	End	Text that appears in the filter for date time columns for the end of the date time range.
DateTimeFilter_Start	Start	Text that appears in the filter for date time columns for the end of the date time range.
EmptyGroupPanel	Drag a column here to group by that column.	Text that appears in the grouping area of the grid when no columns are grouped.
Filter_Clear	Clear	Text that appears in the filter bar to clear the filter condition.
Filter_Filter	Filter	Text that appears in the filter bar to add a filter condition.
NumericFilter_And	And	Text that appears in the filter bar for numeric columns to indicate multiple filter conditions.

NumericFilter_Equals	Equals	Text that appears in the filter bar for numeric columns to indicate the filter condition should apply to exact matches only.
NumericFilter_GreaterOrEquals	Greater/Equals	Text that appears in the filter bar for numeric columns to indicate the filter condition should apply to items with higher values than the condition value or exact matches only.
NumericFilter_Greater	Greater	Text that appears in the filter bar for numeric columns to indicate the filter condition should apply to items with higher values than the condition value.
NumericFilter_Less	Less	Text that appears in the filter bar for numeric columns to indicate the filter condition should apply to items with lower values than the condition value.
NumericFilter_LessOrEquals	Less/Equals	Text that appears in the filter bar for numeric columns to indicate the filter condition should apply to items with lower values than the condition value or exact matches only.
NumericFilter_NotEquals	Not Equals	Text that appears in the filter bar for numeric columns to indicate the filter condition should apply to items that are not an exact match.
NumericFilter_Or	Or	Text that appears in the filter bar for numeric columns to indicate multiple filter conditions.
TextFilter_Contains	Contains	Text that appears in the filter for text

		columns to indicate if the filter condition should apply to items that contain the value of the condition.
TextFilter_Equals	Equals	Text that appears in the filter bar for text columns to indicate the filter condition should apply to exact matches only.
TextFilter_NotEquals	Not Equals	Text that appears in the filter bar for text columns to indicate the filter condition should apply to items that are not an exact match.
TextFilter_StartsWith	Starts With	Text that appears in the filter for text columns to indicate if the filter condition should apply to items that start with the value of the condition.

Adding Supported Cultures

Once you've created resource files for your application, you will need to set the supported cultures for your project. To do so, complete the following steps:

1. In the Solution Explorer, right-click your project and select **Unload Project**. The project will appear grayed out and unavailable.
2. Right click the project again, and select the **Edit ProjectName.csproj** option (or **Edit ProjectName.vbproj**, where *ProjectName* is the name of your project).
3. In the .csproj file, locate the *<SupportedCultures></SupportedCultures>* tags. In between the tags, list the cultures you want to be supported, separating each with a semicolon.

   For example:

   ```
   <SupportedCultures>fr;es;en;it;ru</SupportedCultures>
   ```
   This will support French, Spanish, English, Italian, and Russian.

4. Save and close the .csproj or .vbproj file.
5. In the Solution Explorer, right-click your project and choose **Reload Project** from the content menu.

The project will be reloaded and will now support the specified cultures.

Setting the Current Culture

The **C1DataGrid** control will use localization files automatically according to the culture selected in the application as long as you haven't moved files to another location or excluded files from the project. By default, the current culture is designated as **System.Threading.Thread.CurrentThread.CurrentUICulture**. If you want to use a culture other than the current culture, you can set the desired culture in your application using the following code:

Visual Basic	Copy Code

```
Public Sub New()
       ' Set desired culture, for example here the French (France) locale.
       System.Threading.Thread.CurrentThread.CurrentUICulture = New
System.Globalization.CultureInfo("fr-FR")
       ' InitializeComponent() call.
       ' Add any initialization after the InitializeComponent() call.
       InitializeComponent()
End Sub
```

C#	Copy Code

```
public MainPage()
{
    // Set desired culture, for example here the French (France) locale.
    System.Threading.Thread.CurrentThread.CurrentUICulture = new
System.Globalization.CultureInfo("fr-FR");
    // InitializeComponent() call.
    InitializeComponent();
    // Add any initialization after the InitializeComponent() call.
}
```

Row Details

Row Details Template

The **RowDetailsTemplate** template controls the appearance of the row details area. The row details section appears below a row and can display additional information.

In Expression Blend, you can create an empty template at design time by selecting the **C1DataGrid** control and then clicking **Object | Edit Other Templates | Edit RowDetailsTemplate | Create Empty**.

You can include text, controls, and more in the **RowDetailsTemplate**, including controls bound to data. For example, the following template includes bound and unbound text and check boxes:

XAML	Copy Code

```
<c1:C1DataGrid.RowDetailsTemplate>
   <!-- Begin row details section. -->
   <DataTemplate>
       <Border BorderBrush="DarkGray" BorderThickness="1" Background="Azure">
        <StackPanel Orientation="Horizontal">
            <StackPanel>
                <StackPanel Orientation="Horizontal">
               <!-- Controls are bound to properties. -->
                <TextBlock FontSize="16" Foreground="MidnightBlue"
Text="{Binding Name}" Margin="0,0,10,0" VerticalAlignment="Bottom" />
                <TextBlock FontSize="12" Text="Order Date: "
VerticalAlignment="Bottom"/>
                <TextBlock FontSize="12" Text=" Complete:"
VerticalAlignment="Bottom" />
              CheckBox IsChecked="{Binding Complete, Mode=TwoWay}"
VerticalAlignment="Center" />
                </StackPanel>
                <TextBlock FontSize="12" Text="Notes: " />
                <TextBox FontSize="12" Text="{Binding Notes, Mode=TwoWay}"
Width="420" TextWrapping="Wrap"/>
            </StackPanel>
        </StackPanel>
        </Border>
    </DataTemplate>
    <!-- End row details section. -->
</c1:C1DataGrid.RowDetailsTemplate>
```

Disabling Row Details Toggling

When the grid includes a child grid or you've created a master-detail grid, by default the row details can be toggled so that they are visible or collapsed. If you choose, however, you can disable the toggling the details row feature by setting the CanUserToggleDetails property to

False. Note that you will need to have a grid with row details to view the change in this example.

At Design Time

To disable toggling row details, complete the following steps:

1. Click the C1DataGrid control once to select it.
2. Navigate to the Properties window and locate the **CanUserToggleDetails** property.
3. Clear the check box next to the **CanUserToggleDetails** property.

In XAML

For example to disable toggling row details, add CanUserToggleDetails="False" to the <c1:C1DataGrid> tag so that it appears similar to the following:

```
<c1:C1DataGrid Name="c1datagrid1" Height="180" Width="250"
CanUserToggleDetails="False" />
```

In Code

For example, to disable toggling row details, add the following code to your project:

Visaul Basic	Copy Code

```
Me.C1DataGrid1.CanUserToggleDetails = False
```

C#	Copy Code

```
this.c1DataGrid1.CanUserToggleDetails = false;
```

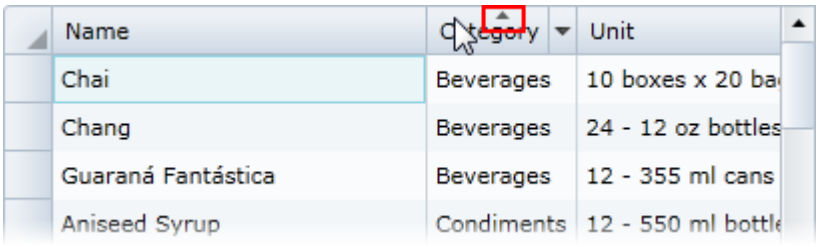
What You've Accomplished

Run the application and observe that you can no longer toggle the row details in the grid at run time. The arrow icon in the row header that indicates that row details can be toggled is no longer visible so toggling rows is not an option.

Sorting

Sorting grid columns at run time is simple in **DataGrid for WPF**. To sort columns click once on the header of the column that you wish to sort.

You will notice that the sort glyph, a sort direction indicator, appears when a column is sorted:



You can click once again on the column header to reverse the sort; notice that the sort glyph changes direction.

Sort multiple columns by sorting one column and then holding the CTRL key while clicking on a second column header to add that column to your sort condition. For example, in the following image the *Category* column was first sorted, and then the *Name* column was reverse sorted:

Note that the **CanUserSort** property must be set to **True** (default) for sorting to be possible.

Disabling Column Sorting

By default end users can sort columns in the grid at run time. For more information, see Sorting Columns. If you choose, however, you can disable the column sorting feature by setting the CanUserSort property to **False**.

At Design Time

To disable column sorting, complete the following steps:

1. Click the C1DataGrid control once to select it.
2. Navigate to the Properties window and locate the **CanUserSort** property.
3. Clear the check box next to the **CanUserSort** property.

In XAML

For example to disable column sorting, add CanUserSort="False" to the <c1:C1DataGrid> tag so that it appears similar to the following:

```
<c1:C1DataGrid Name="c1datagrid1" Height="180" Width="250" CanUserSort="False" />
```

In Code

For example, to disable column sorting, add the following code to your project:

Visual Basic	Copy Code

```
Me.C1DataGrid1.CanUserSort = False
```

C#	Copy Code

```
this.c1DataGrid1.CanUserSort = false;
```

What You've Accomplished

Run the application and observe that you can no longer sort columns at run time. Clicking on a column's header at run time will not sort the grid and the sort indicator is not visible in the column header. For more information about column sorting, see the Sorting Columns topic.

DataGrid Appearance

The following topics describe the C1DataGrid appearance for WPF and Silverlight.

Customizing Grid Appearance

DataGrid Appearance

C1DataGrid Themes

DataGrid for WPF incorporates several themes that allow you to customize the appearance of your grid. When you first add a **C1DataGrid** control to the page, it appears similar to the following image:

This is the control's default appearance. You can change this appearance by using one of the built-in themes or by creating your own custom theme. All of the built-in themes are based on WPF Toolkit themes. The built-in themes are described and pictured below; note that in the images below, a cell has been selected and the mouse is hovering over another cell to show both selected and hover styles:

Theme Name	Theme Preview
C1ThemeBureauBlack	C1ThemeExpressionDark	
C1ThemeExpressionLight	C1ThemeRainierOrange	C1ThemeShinyBlue	

C1ThemeWhistlerBlue	
Editing Templates and Styles

One of the main advantages to using a WPF control is that controls are "lookless" with a fully customizable user interface. Just as you design your own user interface (UI), or look and feel, for WPF applications, you can provide your own UI for data managed by **DataGrid for WPF**. Extensible Application Markup Language (XAML; pronounced "Zammel"), an XML-based declarative language, offers a simple approach to designing your UI without having to write code. DataGrid for WPF includes several templates so that you don't have to begin creating your own UI from scratch.

Accessing Templates

You can access templates in Microsoft Expression Blend by selecting the C1DataGrid control and, in the DataGrid's menu, selecting **Edit Other Templates**. To create a copy of a template that you can edit, open the **C1DataGrid** menu, select **Edit Other Templates**, choose the template you wish to edit, and select either **Edit a Copy**, to create an editable copy of the current template, or **Create Empty**, to create a new blank template.

Note: If you create a new template through the menu, the template will automatically be linked to that template's property. If you manually create a template in XAML you will have to link the appropriate template property to the template you've created.

The **C1DataGrid** control provides several style properties that you can use to completely change the appearance of the control and its rows, columns, headers, and cells. Some of the included styles are described in the table below:

Style	Description
C1DataGrid.CellStyle	Gets or sets the style that is used when rendering the cells.

C1DataGrid.ColumnHeaderStyle	Gets or sets the style that is used when rendering the column headers.
C1DataGrid.DragOverColumnStyle	Style applied to a **ContentControl** element used to show the dragged column while it is moved.
C1DataGrid.DrageSourceColumnStyle	Style applied to a **ContentControl** that is placed over the source column when it starts the drag-and-drop operation.
C1DataGrid.DropIndicatorStyle	Style applied to a **ContentControl** element used to indicate the position where the dragged column will be dropped.
C1DataGrid.FilterStyle	Gets or sets the style used for the filter control container.
C1DataGrid.FocusStyle	Sets the style of the internal **Rectangle** used to show the focus on the **C1DataGrid**.
C1DataGrid.GroupColumnHeaderStyle	Gets or sets the style that is used when rendering the column headers in the group panel.
C1DataGrid.GroupRowHeaderStyle	Gets of sets the style of the header of the group row.
C1DataGrid.GroupRowStyle	Gets of sets the style of the group row.
C1DataGrid.NewRowHeaderStyle	Gets or sets the style that is used when rendering the row header for entering new items.
C1DataGrid.NewRowStyle	Gets or sets the style that is used when rendering the row for entering new items.
C1DataGrid.RowHeaderStyle	Gets or sets the style that is used when rendering the row headers.
C1DataGrid.RowStyle	Gets or sets the style that is used when rendering the

	rows.

Table Formatting Options

The following topics detail table formatting options, including grid headers and placement of table objects.

See Also

Setting Row and Column Header Visibility

Setting Grid Line Visibility

Setting New Row Visibility

Setting Vertical and Horizontal Scrollbar Visibility

Setting Row Details Visibility

Setting Row and Column Header Visibility

By default row and column headers are visible in the grid. However, if you choose, you can set one or both of the headers to be hidden by setting the **HeadersVisibility** property. You can set the **HeadersVisibility** property to one of the following options:

Option	Description
None	Neither row nor column headers are visible in the grid.
Column	Only column headers are visible in the grid.
Row	Only row headers are visible in the grid.
All (Default)	Both column and row headers are visible in the grid.

Setting Grid Line Visibility

By default vertical and horizontal grid lines are visible in the grid. However, if you choose, you can set one or both sets of grid lines to be hidden by setting the **GridLinesVisibility** property. You can set the **GridLinesVisibility** property to one of the following options:

Option	Description
None	Neither horizontal nor vertical grid lines are visible in the grid.
Horizontal	Only horizontal grid lines are visible in the grid.
Vertical	Only vertical grid lines are visible in the grid.
All (Default)	Both horizontal and vertical grid lines are visible in the grid.

Setting New Row Visibility

By default the **Add New row** is located at the bottom of the grid. However, if you choose, you can change its location by setting the **NewRowVisibility** property. You can set the **NewRowVisibility** property to one of the following options:

Option	Description
Top	The **Add New row** appears at the top of the grid.
Bottom (default)	The **Add New row** appears at the bottom of the grid.

Setting Vertical and Horizontal Scrollbar Visibility

By default the grid's horizontal and vertical scrollbars are only visible when the height or width of grid content exceeds the size of the grid. However, if you choose, you can set the scrollbars to be always or never visible, and even disable them altogether, by setting the **VerticalScrollbarVisibility** and **HorizontalScrollbarVisibility** properties. You can set the **VerticalScrollbarVisibility** and **HorizontalScrollbarVisibility** properties to one of the following options:

Option	Description
Disabled	The chosen scrollbar is disabled.
Auto	The chosen scrollbar appears only when the content of the grid exceeds the grid

(default)	window.
Hidden	The chosen scrollbar appears to be hidden.
Visible	The chosen scrollbar is always visible.

Setting Row Details Visibility

By default row details are collapsed and not visible. You can use the **RowDetailsVisibilityMode** property to set if and when row details are visible. You can set the **RowDetailsVisibilityMode** property to one of the following options:

Option	Description
VisibleWhenSelected	Row details are only visible when selected.
Visible	Row details are always visible.
Collapsed (default)	Row details appear collapsed and are not visible.

C1DataGrid Brushes

DataGrid for WPF provides several brush properties that you can use to completely change the appearance of the control and its rows, columns, headers, and cells. Some of the included brushes are described in the table below:

Theme Name	Theme Preview
Background	Gets or sets the background brush that is used when rendering. (This brush will be applied to all the parts of the data grid)
Foreground	Gets or sets the foreground

	brush that is used when rendering. (This brush will be applied to all the parts of the data grid)
BorderBrush	Gets or sets the border brush that is used when rendering. (This brush will be applied to some of the parts of the data grid depending on the theme)
SelectedBrush	Gets or sets the selected brush that is used when rendering selected rows and row and column headers, etc.
MouseOverBrush	Gets or sets the mouse over brush that is used when mouse is over rows and row and column headers, etc.
RowBackground	Gets or sets the background brush of a row.
RowForeground	Gets or sets the foreground brush of a row.
AlternatingRowBackground	Gets or sets the background brush of an alternating row.
AlternatingRowForeground	Gets or sets the foreground brush of an alternating row.
HorizontalGridLinesBrush	Gets of sets the brush applied to the horizontal

	lines.
VerticalGridLinesBrush	Gets of sets the brush applied to the vertical lines.

DataGrid for WPF uses ClearStyle technology for styling. For details, see C1DataGrid ClearStyle.

C1DataGrid Clear Style

DataGrid for WPF supports ComponentOne's new ClearStyle technology that allows you to easily change control colors without having to change control templates. By just setting a few color properties you can quickly style the entire grid.

You can completely change the appearance of the **C1DataGrid** control by simply setting a few properties, such as the **C1DataGrid.Background** property which sets the color scheme of the **C1DataGrid** control. For example, if you set the **Background** property to "#FF663366" so the XAML markup appears similar to the following:

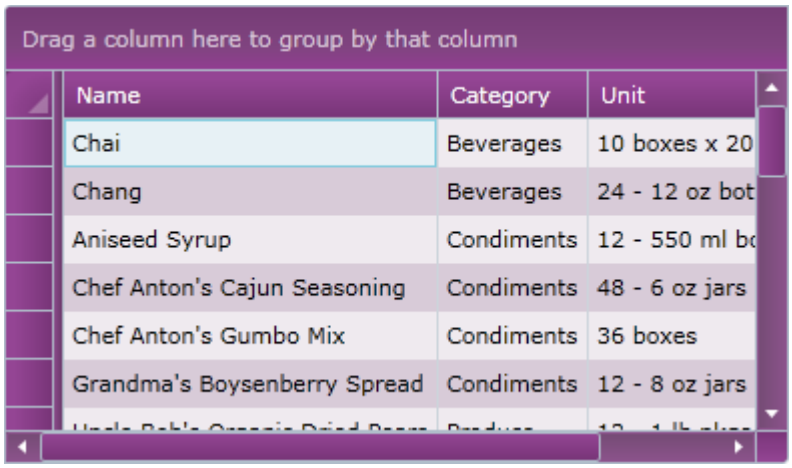
```
<c1:C1DataGrid HorizontalAlignment="Left" Margin="10,10,0,0" Name="c1DataGrid1"
VerticalAlignment="Top" CanUserFreezeColumns="Left" CanUserGroup="True"
Background="#FFFFFFCC"/>
```

The grid will appear similar to the following image:

If you set the **Background** property to "#FF663366" and the **Foreground** property to "White", so the XAML markup appears similar to the following:

```
<c1:C1DataGrid HorizontalAlignment="Left" Margin="10,10,0,0" Name="c1DataGrid1"
VerticalAlignment="Top" CanUserFreezeColumns="Left" CanUserGroup="True"
Background="#FF663366" Foreground="White"/>
```

The grid will appear similar to the following image:

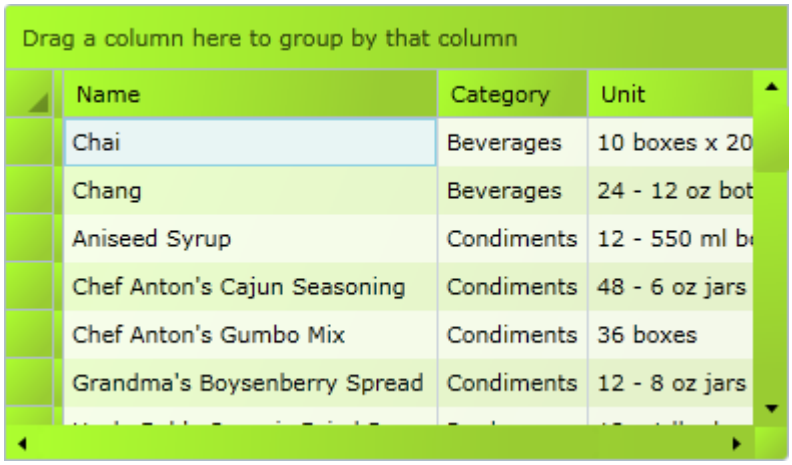


You can even set the **Background** property to a gradient value, for example with the following XAML:

XAML	Copy Code

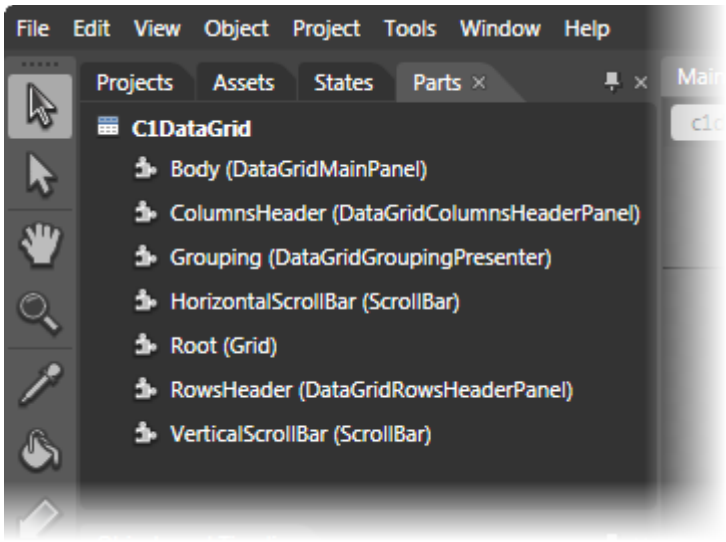
```
<c1:C1DataGrid x:Name="c1DataGrid1" HorizontalAlignment="Left"
Margin="10,10,0,0" VerticalAlignment="Top" CanUserFreezeColumns="Left"
CanUserGroup="True">
   <c1:C1DataGrid.Background>
       <LinearGradientBrush StartPoint="0,0" EndPoint="1,1">
           <GradientStop Color="GreenYellow" Offset="0.0" />
           <GradientStop Color="YellowGreen" Offset="0.85" />
       </LinearGradientBrush>
   </c1:C1DataGrid.Background>
</c1:C1DataGrid>
```

The grid will appear similar to the following image:



C1DataGrid Template Parts

In Microsoft Expression Blend, you can view and edit template parts by creating a new template (for example, click the **C1DataGrid** control to select it and choose **Object | Edit Template | Edit a Copy**). Once you've created a new template, the parts of the template will appear in the **Parts** window:



Note that you may have to select the **ControlTemplate** for its parts to be visible in the **Parts** window.

In the Parts window, you can double-click any element to create that part in the template. Once you have done so, the part will appear in the template and the element's icon in the **Parts** pane will change to indicate selection:

Template parts available in the **C1DataGrid** control include:

Name	Type	Description
Body	DataGridMainPanel	Panel that contains the body of the grid.
ColumnsHeader	DataGridColumnsHeaderPanel	Panel that contains a collection of DataGridColumnsHeaderPanel.
Grouping	DataGridGroupingPresenter	Presenter that displays the grouping panel or another element if there is no columns in the grouping panel.

HorizontalScrollBar	ScrollBar	Represents a control that provides a scroll bar that has a sliding Thumb whose position corresponds to a value.
Root	Grid	Definies a flexible grid area that consists of columns and rows.
RowsHeader	DataGridRowsHeaderPanel	Panel that contains DataGridRowsHeaderPanel.
VerticalScrollBar	ScrollBar	Represents a control that provides a scroll bar that has a sliding Thumb whose position corresponds to a value.

Customizing Grid Appearance

The following topics detail how you can customize **C1DataGrid** by changing the grid's appearance. **DataGrid for WPF and Silverlight** includes several appearance options that incorporate ComponentOne's unique ClearStyle technology. For example, you can change the background color of the grid or the alternating row background. Note for more information about ClearStyle technology, see the C1DataGrid ClearStyle topic. The follow topics also detail changing the layout of the grid, including how to set the location of the header and add new row bar.

Changing the Grid's Background and Foreground Color

DataGrid for WPF includes ComponentOne's unique ClearStyle technology that enables you to change the entire appearance of the grid simply and flawlessly. The following steps will detail how to set the **C1DataGrid.Background** property to completely change the appearance of the grid. For more details about ComponentOne's ClearStyle technology, see the C1DataGrid ClearStyle topic.

At Design Time

To change the grid's foreground and background color so that it appears green, complete the following steps:

1. Click the C1DataGrid control once to select it.
2. Navigate to the Properties window and click the drop-down arrow next to the **Background** property.
3. Click the drop-down arrow in the box the hex code appears in, and choose **Green**.
4. Navigate to the Properties window and click the drop-down arrow next to the **Foreground** property.

5. Click the drop-down arrow in the box the hex code appears in, and choose **White**.

In XAML

For example to change the grid's foreground and background color so that it appears green, add to the <c1:C1DataGrid> tag so that it appears similar to the following:

<c1:C1DataGrid Name="c1datagrid1" Height="180" Width="250" Background="Green" Foreground="White" />

In Code

For example, to change the grid's foreground and background color so that it appears green, add the following code to your project:

Visual Basic	Copy Code

```
Me.C1DataGrid1.Background = New
System.Windows.Media.SolidColorBrush(Colors.Green)
Me.C1DataGrid1.ForeGround = New
System.Windows.Media.SolidColorBrush(Colors.White)
```

C#	Copy Code

```
this.c1DataGrid1.Background = new System.Windows.Media.
SolidColorBrush(Colors.Green);
this.c1DataGrid1.Foreground = new System.Windows.Media.
SolidColorBrush(Colors.White);
```

What You've Accomplished

Run the application and observe that the grid now appears green with white text in the grid header.

Note that with the **C1DataGrid** control's ClearStyle technology, the color of the grid, the grid's scrollbars, and the alternating row background of the grid all changed to reflect the green background. Highlight an item in the grid and notice the mouse hover style did not change; you can customize these styles as well if you choose. See Changing the Grid's Mouse Hover Style for more details.

Removing the Grid's Alternating Row Colors

DataGrid for WPF appears with alternating row colors by default. Alternating row colors are when alternate lines appear in a different color than the base color of the grid. This is helpful so that rows are easier to follow across the grid, but if you choose you can make the appearance of the grid uniform by removing the alternating row colors.

At Design Time

To remove alternating row colors and set it so all rows appear white, complete the following steps:

1. Click the **C1DataGrid** control once to select it.
2. Navigate to the Properties window and click the drop-down arrow next to the RowBackground property.
3. Click the drop-down arrow in the box the hex code appears in, and choose White.
4. Navigate to the Properties window and click the drop-down arrow next to the AlternatingRowBackground property.
5. Click the drop-down arrow in the box the hex code appears in, and choose White.

In XAML

To remove alternating row colors and set it so all rows appear white, add RowBackground="White" AlternatingRowBackground="White" to the <c1:C1DataGrid> tag so that it appears similar to the following:

<c1:C1DataGrid Name="c1datagrid1" Height="180" Width="250" RowBackground="White" AlternatingRowBackground="White" />

In Code

To remove alternating row colors and set it so all rows appear white, add the following code to your project:

Visual Basic	Copy Code

```
Me.C1DataGrid1.RowBackground = New
System.Windows.Media.SolidColorBrush(Colors.White)
Me.C1DataGrid1.AlternatingRowBackground = New
System.Windows.Media.SolidColorBrush(Colors.White)
```

C#	Copy Code

```
this.c1DataGrid1.RowBackground = new System.Windows.Media.
SolidColorBrush(Colors.White);
this.c1DataGrid1.AlternatingRowBackground = new System.Windows.Media.
SolidColorBrush(Colors.White);
```

What You've Accomplished

Run the application and observe that all rows in the grid now appear white.

Changing the Grid's Mouse Hover Style

By default, columns and rows that are moused over appear in a different color to indicate to users what area of the grid they are interacting with. If you choose you can customize the appearance of cells that are moused over. For example, you may want to highlight these cells even more or remove this effect.

At Design Time

To set the mouse over effect to yellow, complete the following steps:

1. Click the C1DataGrid control once to select it.
2. Navigate to the Properties window and click the drop-down arrow next to the MouseOverBrush property.
3. Click the drop-down arrow in the box the hex code appears in, and choose **Yellow**.

In XAML

To set the mouse over effect to yellow, add MouseOverBrush="Yellow" to the <c1:C1DataGrid> tag so that it appears similar to the following:

```
<c1:C1DataGrid Name="c1datagrid1" Height="180" Width="250" MouseOverBrush="Yellow"
/>
```

In Code

To set the mouse over effect to yellow, add the following code to your project:

Visual Basic	Copy Code

```
Me.c1datagrid1.MouseOverBrush = New
System.Windows.Media.SolidColorBrush(Colors.Yellow)
```

C#	Copy Code

```
this.c1datagrid1.MouseOverBrush = new
System.Windows.Media.SolidColorBrush(Colors.Yellow);
```

What You've Accomplished

Run the application and observe that all highlighted rows and columns in the grid now appear yellow.

Changing the Grid's Font Style

You may want to update the font style that appears in **DataGrid for WPF** when the control is run. For example, you may want to change the style of the grid, an element of which is the font style, to match your application's appearance.

At Design Time

To change the font style, complete the following steps:

1. Click the **C1DataGrid** control once to select it.
2. Navigate to the Properties window and click the drop-down arrow next to the **FontFamily** property and choose Times New Roman.
3. Navigate to the Properties window and click the drop-down arrow next to the **FontSize** property and choose 10.

In XAML

To change the font style, add FontFamily="Times New Roman" FontSize="10" to the <c1:C1DataGrid> tag so that it appears similar to the following:

<c1:C1DataGrid Name="c1datagrid1" Height="180" Width="250" FontFamily="Times New Roman" FontSize="10" />

In Code

To remove alternating row colors and set it so all rows appear white, add the following code to your project:

Visual Basic	Copy Code

```
Me.c1datagrid1.FontFamily = New FontFamily("Times New Roman")
Me.c1datagrid1.FontSize = 10
```

C#	Copy Code

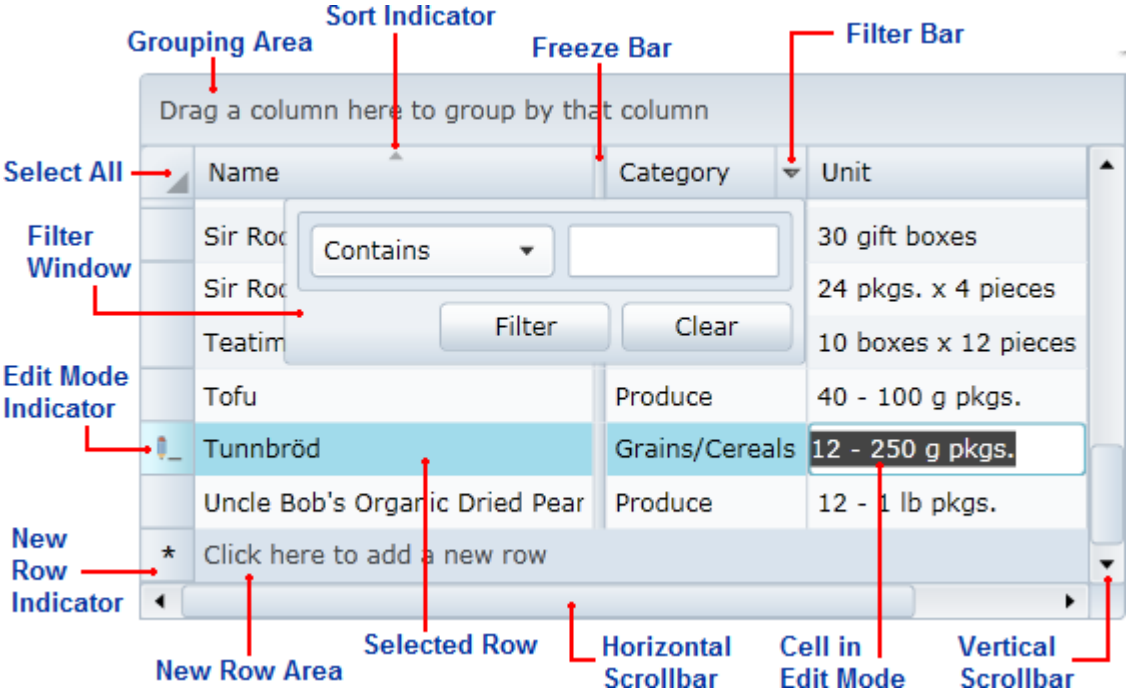
```
this.c1datagrid1.FontFamily = new FontFamily("Times New Roman");
this.c1datagrid1.FontSize = 10;
```

What You've Accomplished

Run the application and observe that all rows in the grid appear in the Times New Roman font.

Run-time Interaction

The image below highlights some of the run-time interactions possible in the **DataGrid for WPF** control:



The following topics detail these run-time features including filtering, sorting, and grouping data.

See Also

Sorting

Freezing

Selection Mode

You can set the grid's selection mode behavior by setting the **SelectionMode** property. You can change how users interact with the grid, but setting the **SelectionMode** property to one of the following values:

Property	Description
None	The user cannot select any item.
SingleCell	The user can select only one cell at a time.

SingleRow	The user can select only one row at a time.
SingleColumn	The user can select only one column at a time.
SingleRange	The user can select only one cells range at a time. (A range is the rectangle delimited by two cells)
MultiRow (Default)	The user can select multiple rows while holding down the corresponding modifier key.
MultiColumn	The user can select multiple columns while holding down the corresponding modifier key.
MultiRange	The user can select multiple cells ranges while holding down the corresponding modifier key.

For more information about modifier keys and the **MultiRow** option, see the Multiple Row Selection topic.

Customizing Automatically Generated Columns

You can customize columns even if columns are automatically generated. If the **AutoGenerateColumns** property is set to True and columns are automatically generated, you can customize how generated columns are displayed in code by handling the **C1DataGrid.AutoGeneratingColumn** event.

Adding the AutoGeneratingColumn Event Handler

Complete the following steps to add the **AutoGeneratingColumn** event handler:

1. Switch to Code view and add an event handler for the **AutoGeneratingColumn** event, for example:

Visual Basic	Copy Code

```
Private Sub C1DataGrid1_AutoGeneratingColumn(ByVal sender As System.Object,
ByVal e As C1.WPF.DataGrid.DataGridAutoGeneratingColumnEventArgs) Handles
C1DataGrid1.AutoGeneratingColumn
  ' Add code here.
End Sub
```

C#	Copy Code

```
private void C1DataGrid1_AutoGeneratingColumn(object sender,
C1.WPF.DataGrid.DataGridAutoGeneratingColumnEventArgs e)
    {
         // Add code here.
    }
```

2. Switch to Source view and add the event handler to instances of the **C1DataGrid** control, for example:

<c1:C1DataGrid x:Name="c1DataGrid1" AutoGenerateColumns="True" **AutoGeneratingColumn=" c1DataGrid1_AutoGeneratingColumn"**></c1:C1DataGrid>

You can now add code to the **AutoGeneratingColumn** event handler to customize the appearance and behavior of automatically generated columns. Below are examples of customizing column formatting and behavior.

Canceling Column Generation

You can cancel the generation of specific columns in the **AutoGeneratingColumn** event. For example, you can use the following code to cancel the generation of Boolean columns in the grid:

Visual Basic	Copy Code

```
<c1:C1DataGrid x:Name="c1DataGrid1" AutoGenerateColumns="True"
AutoGeneratingColumn=" Private Sub C1DataGrid1_AutoGeneratingColumn(ByVal
sender As System.Object, ByVal e As
C1.WPF.DataGrid.DataGridAutoGeneratingColumnEventArgs) Handles
C1DataGrid1.AutoGeneratingColumn
' Cancel automatic generation of all Boolean columns.
    If e.Property.PropertyType Is GetType(Boolean) Then
        e.Cancel = True
    End If
End Sub
```

C#	Copy Code

```
private void c1DataGrid1_AutoGeneratingColumn(object sender,
```

```
C1.WPF.DataGrid.DataGridAutoGeneratingColumnEventArgs e)
{
    // Cancel automatic generation of all Boolean columns.
    if (e.Property.PropertyType == typeof(bool))
        e.Cancel = true;
}
```

Changing a Column Header

In the **AutoGeneratingColumn** event you can change the text that appears in the header of automatically generated columns. For example, you can change the "ProductName" column so that it appears with the "Name" header using the following code:

Visual Basic	Copy Code

```
Private Sub C1DataGrid1_AutoGeneratingColumn(ByVal sender As System.Object,
ByVal e As C1.WPF.DataGrid.DataGridAutoGeneratingColumnEventArgs) Handles
C1DataGrid1.AutoGeneratingColumn
    ' Modify the header of the ProductName column.
    If e.Column.Header.ToString() = "ProductName" Then
        e.Header = "Name"
    End If
End Sub
```

C#	Copy Code

```
private void c1DataGrid1_AutoGeneratingColumn(object sender,
C1.WPF.DataGrid.DataGridAutoGeneratingColumnEventArgs e)
{
    // Modify the header of the ProductName column.
    if (e.Column.Header.ToString() == "ProductName")
        e.Column.Header = "Name";
}
```

Preventing Column Interaction

Using the **AutoGeneratingColumn** event you can change how end users interact with specific generated columns. For example, you can prevent users from moving read-only columns with the following code:

Visual Basic	Copy Code

```
Private Sub C1DataGrid1_AutoGeneratingColumn(ByVal sender As System.Object,
ByVal e As C1.WPF.DataGrid.DataGridAutoGeneratingColumnEventArgs) Handles
C1DataGrid1.AutoGeneratingColumn
    ' Modify the header of the ProductName column.
    If e.Column.IsReadOnly = True Then
       e.Column.CanUserMove = False
    End If
End Sub
```

C#	Copy Code

```
private void c1DataGrid1_AutoGeneratingColumn(object sender,
C1.WPF.DataGrid.DataGridAutoGeneratingColumnEventArgs e)
{
    // Modify the header of the ProductName column.
    if (e.Column.IsReadOnly == true)
        e.Column.CanUserMove = false;
}
```

DataGrid Samples

Please be advised that this ComponentOne software tool is accompanied by various sample projects and/or demos, which may make use of other ComponentOne development tools included with the ComponentOne Studio.

You can refer to pre-installed product samples through the following path

Documents | ComponentOne | WPF.

Several pages in the sample installed with **WPF Edition** details the C1DataGrid control's functionality (grouping, filtering, sorting), appearance (conditional formatting, templates, custom columns and rows), behavior (drag-and-drop behavior, validation, export), and more.

Task-Based Help

The following task-based help topics assume that you are familiar with Visual Studio and Expression Blend and know how to use the **C1DataGrid** control in general. If you are unfamiliar with the **DataGrid for WPF and Silverlight**, please see the Quick Start first.

Each topic in this section provides a solution for specific tasks using the **C1DataGrid** product. Most task-based help topics also assume that you have created a new WPF or Silverlight project and added a **C1DataGrid** control to the project – for information about creating the control, see Creating a DataGrid.

Creating a DataGrid

Creating a DataGrid

You can easily create a **C1DataGrid** control at design time in Expression Blend, in XAML, and in code. Note that if you create a **C1DataGrid** control as in the following steps, it will appear empty. You will need to bind the grid or populate it with data.

At Design Time in Blend

To create a **C1DataGrid** control in Blend, complete the following steps:

1. Navigate to the Projects window and right-click the References folder in the project files list. In the context menu choose Add Reference, locate and select the C1.WPF.DataGrid.dll assembly, and click Open.

   The dialog box will close and the references will be added to your project and the controls will be available in the Asset Library.

2. In the Toolbox click on the Assets button (the double chevron icon) to open the Assets dialog box.
3. In the Asset Library dialog box, choose the Controls item in the left pane, and then click on the C1DataGrid icon in the right pane:

   The **C1DataGrid** icon will appear in the Toolbox under the **Assets** button.

4. Click once on the design area of the UserControl to select it. Unlike in Visual Studio, in Blend you can add WPF controls directly to the design surface as in the next step.
5. Double-click the C1DataGrid icon in the Toolbox to add the control to the panel. The **C1DataGrid** control will now exist in your application.
6. If you choose, can customize the control by selecting it and setting properties in the Properties window. For example, set the **C1DataGrid** control's Name property to "c1datagrid1" the Height property to "180", and the Width property to "250".

In XAML

To create a **C1DataGrid** control using XAML markup, complete the following steps:

1. In the Visual Studio Solution Explorer, right-click the References folder in the project files list. In the context menu choose Add Reference, select the C1.WPF.DataGrid.dll assembly, and click OK.
2. Add a XAML namespace to your project by adding **xmlns:c1="http://schemas.componentone.com/winfx/2006/xaml** to the initial <UserControl><Window> tag. It will appear similar to the following:

XAML	Copy Code

```
<Window xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:c1="http://schemas.componentone.com/winfx/2006/xaml"
x:Class="C1DataGrid.MainWindow" Width="640" Height="480"><UserControl
xmlns="http://schemas.microsoft.com/winfx/2006/xaml/presentation"
xmlns:x="http://schemas.microsoft.com/winfx/2006/xaml"
xmlns:c1="http://schemas.componentone.com/winfx/2006/xaml
x:Class="C1DataGrid.MainPage" Width="640" Height="480">
```

3. Add a <c1:C1DataGrid> tag to your project within the <Grid> tag to create a **C1DataGrid** control. The markup will appear similar to the following:

XAML	Copy Code

```
<Grid x:Name="LayoutRoot" Background="White">
    <c1:C1DataGrid Name="c1datagrid1" Height="180" Width="250" />
</Grid>
```

4. This markup will create an empty **C1DataGrid** control named "c1datagrid1" and set the control's size.

In Code

To create a **C1DataGrid** control in code, complete the following steps:

1. In the Visual Studio Solution Explorer, right-click the References folder in the project files list. In the context menu choose Add Reference, select the C1.WPF.dll and C1.WPF.DataGrid.dll assemblies, and click OK.
2. Right-click within the MainPage.xamlMainWindow.xaml window and select View Code to switch to Code view
3. Add the following import statements to the top of the page:

Visual Basic	Copy Code

```
Imports C1.WPF|variable=WPF.DataGrid
```

C#	Copy Code

```
using C1.WPF|variable=WPF.DataGrid;
```

4. Add code to the page's constructor to create the C1DataGrid control. It will look similar to the following:

Visual Basic	Copy Code

```
Public Sub New()
    InitializeComponent()
    Dim c1datagrid1 As New C1DataGrid
    c1datagrid1.Height = 180
    c1datagrid1.Width = 250
    LayoutRoot.Children.Add(c1datagrid1)
End Sub
```

5.
6.

C#	Copy Code

```
public MainPage()
{
    InitializeComponent();
    C1DataGrid c1datagrid1 = new C1DataGrid();
    c1datagrid1.Height = 180;
    c1datagrid1.Width = 250;
    LayoutRoot.Children.Add(c1datagrid1);
}
```

7. This code will create an empty C1DataGrid control named "c1datagrid1", set the control's size, and add the control to the page.

What You've Accomplished

Run your application and observe that you've created a C1DataGrid control.

Note that when you create a **C1DataGrid** control as in the above steps, it will appear empty. You can add items to the control that can be interacted with at run time.

API Reference

C1.Silverlight.DataGrid.5 Assembly

Namespaces

C1.Silverlight.DataGrid Namespace

Overview

Classes

	Class	Description
	C1CollectionChangedEventArgs	Provides event data for changes in the data source collection.
	C1DataGrid	Used to display, analyze, and edit tabular information. Supports virtualized data-binding, xaml styling and automatic sorting and filters in client/server scenarios.
	C1DataGridFilterHelper	Provides helper methods to work with custom filters in C1DataGrid.
	C1RowIndexHeaderBehavior	Displays the row index in the row header
	C1ValidationBehavior	Validates rows automatically on loading and after committed row.
	ComboValueInfo	Value wrapper for DataGridComboBoxFilter. The filter values are set in the DataGridComboBoxFilter.Values property.
	DataGridAutoGeneratingColumnEventArgs	Provides event data for auto generating column events.

DataGridBeganEditEventArgs	Provides event data for BeganEdit event.
DataGridBeginningEditEventArgs	Provides event data for editing event.
DataGridBeginningNewRowEventArgs	Provides event data for new row beginning event.
DataGridBoundColumn	Represent a DataGridColumn which is bound to a data property.
DataGridBoundConverter	Multi-purpose converter.
DataGridCell	Represents an individual C1DataGrid cell.
DataGridCellEventArgs	Provides event data for events related to cells.
DataGridCellPresenter	Represent the visual element of a cell.
DataGridCellsPanel	Panel which contains the cells.
DataGridCellsRange	Specifies a range of cells determined by two cells.
DataGridCellsRangeCollection	Collection of DataGridCellsRange.
DataGridCheckBoxColumn	Represent a DataGridColumn that hosts Boolean content in its cells
DataGridCheckBoxConverter	Converts Boolean values to string values according to the settings of the passed check box column.
DataGridCheckBoxFilter	Visual element that display a checkbox to filter by its value. Represents the default filter control for checkbox columns.
DataGridColumn	Represent a column in the grid

DataGridColumnCollection	Represent the collection of columns of the data grid
DataGridColumnEditableValueEventArgs<T>	Provides event data for events related to columns and associated value
DataGridColumnEventArgs	Provides event data for events related to columns
DataGridColumnHeaderPresenter	Content Control that represent the header of a column, this control contains the sort, resize and filter elements.
DataGridColumnHeaderRow	Represents a C1.Silverlight.DataGrid row whose cells are column headers.
DataGridColumnHeaderTypeConverter	Converts a string to a list of headers and vice versa.
DataGridColumnReorderingEventArgs	Provides event data for ColumnReordering event.
DataGridColumnsHeaderPanel	Panel that contains a collection of DataGridColumnsHeaderPanel.
DataGridColumnValue<T>	Contains extra information about a column.
DataGridColumnValueEventArgs<T>	Provides event data for events related to columns and associated value
DataGridComboBoxColumn	Represent a DataGridColumn that hosts enumerable content in its cells
DataGridComboBoxFilter	Represents the default filter control for combo-box columns.
DataGridCreatingRowEventArgs	Provides event data for CreatingRow event.

DataGridDateFilter	The filter for date values. This control should be used as InnerControl for the DataGridFilter control to create the date filter for the C1DataGrid. Represents the default filter control for date columns.
DataGridDateTimeColumn	Represent a DataGridColumn which is bound to a data property representing **System.DateTime** or **System.Nullable`1** values.
DataGridDateTimeConverter	DateTime Converter.
DataGridDateTimeFilter	The filter for DateTime values. This control should be used as InnerControl for the DataGridFilter control to create the DateTime filter for the C1DataGrid. Represents the default filter control for DateTime columns.
DataGridDefaultInputHandlingStrategy	This instance manages the keyboard events navigating through the cells.
DataGridDeletingRowsEventArgs	Provides event data for DeletingRows event.
DataGridDetailsPresenter	Represent the visual element of the details of a row.
DataGridEditingRowEventArgs	Provides event data for editing events.
DataGridEndingEditEventArgs	Provides event data for ending cell edit events.
DataGridEndingNewRowEventArgs	Provides event data for ending new row events.
DataGridFilter	Represents the Control that hosts the filters for the C1DataGrid.

DataGridFilterChangedEventArgs	Provides event data for FilterChanged event.
DataGridFilterChangingEventArgs	Provides event data for FilterChanging event.
DataGridFilterException	This error is raised when FilterBy method is called but the collection view is not ready.
DataGridFilterInfo	Contains the filter information used to create filters for a C1DataGrid column. A filter can be constructed by one or more FilterInfo instances.
DataGridFilterLoadingEventArgs	Provides event data for the FilterLoading event of DataGridColumn.
DataGridFilterState	State of the filter.
DataGridFinalizeEditingException	This error is raised when the editing cell couldn't be committed.
DataGridFocusPresenter	Represent the visual element of the focus which is used inside a cell.
DataGridGettingCellValueEventArgs	Provides event data for GettingCellValue event of DataGridTemplateColumn.
DataGridGroupChangedEventArgs	Provides event data for group changed events.
DataGridGroupChangingEventArgs	Provides event data for GroupChanging event.
DataGridGroupColumnHeaderPresenter	Represent the visual element of an item of the grouping panel.
DataGridGroupException	This error is raised when GroupBy method is called but the collection view is not ready.

	DataGridGroupingPanel	Panel used to group by columns.
	DataGridGroupingPresenter	Presenter that display the grouping panel or another element if there is no columns in the grouping panel.
	DataGridGroupRow	Represents a C1.Silverlight.DataGrid group row.
	DataGridGroupRowPresenter	Row presenter that represents a group.
	DataGridGroupState	Sort state of a column.
	DataGridGroupStateTypeConverter	Converts a string to a DataGridSortState. Used to set a sort state from xaml.
	DataGridHyperlinkColumn	Represent a DataGridColumn that hosts hyperlink content in its cells.
	DataGridImageColumn	Represent a DataGridColumn that hosts image content in its cells
	DataGridLengthTypeConverter	Converts a string to a DataGridLength and vice versa.
	DataGridMergingCellsEventArgs	Provides event data for merging cells events.
	DataGridMultiValueFilter	filter which contains a list of items with a checkbox for each option.
	DataGridNewRow	Represents a C1.Silverlight.DataGrid new row.
	DataGridNewRowHeaderPresenter	Represent the visual element of a new row header.
	DataGridNewRowPresenter	Represent the visual element of a new row.
	DataGridNumericColumn	Represent a DataGridColumn that hosts

		numeric content in its cells.
	DataGridNumericConverter	Numeric Converter.
	DataGridNumericFilter	The filter for numeric values. This control should be used as InnerControl for the DataGridFilter control to create the numeric filter for the C1DataGrid. Represents the default filter control for numeric columns.
	DataGridRow	Represents a DataGrid row.
	DataGridRowCollection	Collection of DataGridRow.
	DataGridRowDetailsEventArgs	Provides event data for events related to row details.
	DataGridRowError	Describes an error associated with a DataGridRow.
	DataGridRowEventArgs	Provides event data for events related to rows
	DataGridRowHeaderColumn	Column whose cells are row headers. This column is typically aligned to the left and can be used with other columns of this type in order to merge row headers.
	DataGridRowHeaderPresenter	Represent the visual element of a row header.
	DataGridRowPresenter	Represent the visual element of a row.
	DataGridRowsAddedEventArgs	Provides event data for RowsAdded event.
	DataGridRowsDeletedEventArgs	Provides event data for RowsDeleted event.
	DataGridRowsHeaderPanel	Panel that contains DataGridRowsHeaderPanel.

	DataGridRowsPanel	Main Panel of the data grid which contains the rows and details.
	DataGridScrollStepConverter	Converts a string to a DataGridScrollStepConverter.
	DataGridSelectableRowPresenter	Represent the visual element of a row which contains an element for selection and mouse over.
	DataGridSelectedItemsCollection<T>	Collection of selected cells, columns or rows.
	DataGridSelection	Manages the selected cells, columns and rows.
	DataGridSelectionChangedEventArgs	Provides event data for selection changed event.
	DataGridSelectionDragEventArgs	Provides event data for selection dragging events.
	DataGridSelectionDragStartedEventArgs	Provides event data for selection drag started event.
	DataGridSelectionManager	Manages the selection.
	DataGridSelectionModeExtension	Extends the SelectionMode enumeration to classify then into groups.
	DataGridSettingCellValueEventArgs	Provides event data for SettingCellValue event of DataGridTemplateColumn.
	DataGridSortChangedEventArgs	Provides event data for SortChanged event.
	DataGridSortChangingEventArgs	Provides event data for SortChanging event.
	DataGridSortException	This error is raised when SortBy method is

		called but the collection view is not ready.
	DataGridSortState	Sort state of a column.
	DataGridSortStateTypeConverter	Converts a string to a DataGridSortState. Used to set a sort state from xaml.
	DataGridTemplateColumn	Represent a DataGridColumn whose templates are specified by the user.
	DataGridTextColumn	Represent a DataGridColumn that hosts textual content in its cells
	DataGridTextFilter	The filter for text values. This control should be used as InnerControl for the DataGridFilter control to create the text filter for the C1DataGrid. Represents the default filter control for text columns.
	DataGridToggleGroupButton	Button used to toggle a group.
	DataGridUriConverter	Converts Uri's from string and vice versa.
	DataGridVerticalFreezingSeparatorPresenter	Represent the visual element of a freezing vertical separator.
	DataGridViewport	Contains information about the visible area of the data grid, like which columns and rows are being visible, size of the viewport, etc.
	DataGridViewProperties	Contains extra information of the view.
	FilterDescription	Contains info about a filter.
	FilterInfo	Contains the filter information used to create filters for a C1DataGrid column. A filter can be constructed by one or more FilterInfo

		instances.
	GroupDescription	Contains info about a group.
	NumericComparator	Represents a numeric comparator used to populate the filter.
	RecyclingPanel	Base panel which manages the recycling life of its items.
	SortDescription	Defines the direction and the property name to be used as the criteria for sorting a collection.
	StringListConverter	Convert a coma separated list of strings to a `List<string>`.

Interfaces

	Interface	Description
	IDataGridFilter	Defines the interface required to support data filtering in the C1DataGrid.
	IDataGridFilterUnity	Interface used to implement a filter unity which will display a user interface where users can change the filter criteria.
	IDataGridInputHandlingStrategy	Input handling strategy interface

Structures

	Structure	Description
	DataGridLength	Describe a length which can be expressed in absolute measures like pixels or relative as auto or star.
	DataGridScrollStep	Represent the length used to scroll a step, typically the up/down

		buttons in the scrollbar, and the mouse wheel.
	DataGridTextFilterEntry	Entry for a supported FilterOperation in DataGridTextFilter.

Delegates

	Delegate	Description
	C1CollectionChangedEventHandler	Is risen when a change in the data source collection occurs.
	CancellingCellEditEventHandler	Handles cancelling cell edit event.
	EndingCellEditEventHandler	Handles ending cell edit event.
	LoadingFilterEventHandler	Handles the loading filter event.
	PreparingCellEditEventHandler	Handles preparing cell edit event.

Enumerations

	Enumeration	Description
	C1DataGridScrollMode	Scroll Modes supported by the C1DataGrid.
	C1DateTimeColumnEditMode	Determines the DataGridDateTimeColumn edit mode.
	C1RowIndexHeaderMode	
	DataGridClipboardMode	Defines constants that specify whether users can copy data from a **C1FlexGrid** control to the clipboard and whether column header values are included.
	DataGridColumnFreezing	Determines all possible freezing states of the columns.
	DataGridColumnHeaderClickAction	Determines the action will be raised when user click in a column header.

	DataGridDateTimeColumnEditMode	Determines the DataGridDateTimeColumn edit mode.
	DataGridFilterCombination	Represents the valid filter combinations to create a FilterInfo.
	DataGridFilterOperation	Represents the valid operations to create a FilterInfo.
	DataGridFilterType	Represents the valid filter types to create a FilterInfo.
	DataGridGridLinesVisibility	Specifies constants that define which grid lines separating DataGrid inner cells are shown.
	DataGridGroupRowPosition	Determine the position of the group row.
	DataGridHeadersVisibility	Determines whether the row/column headers are shown or not.
	DataGridNewRowVisibility	Determines where the new row will be placed.
	DataGridOptionsVisibility	
	DataGridRowDetailsVisibilityMode	Determines the visibility mode of the row details.
	DataGridRowType	Specifies constants that define the different types of rows.
	DataGridScrollMode	Scroll Modes supported by the C1DataGrid.
	DataGridScrollStepUnitType	Unit used to scroll in the data grid.
	DataGridSelectionMode	Determines the available selection modes.
	DataGridSortDirection	Direction of the sort state.
	DataGridUnitType	Describes the kind of value that DataGridLength object is holding.
	FilterCombination	Represents the valid filter combinations to create a

		FilterInfo.
	FilterOperation	Represents the valid operations to create a FilterInfo.
	FilterType	Represents the valid filter types to create a FilterInfo.
	ScaleMode	Specifies how the grid content should be scaled to fit the page.

AddedItems Property

Gets the item affected by an Add operation.

Syntax

Visual Basic (Declaration)

```
Public Property AddedItems As System.Collections.Generic.KeyValuePair(Of
Integer,Object)()
```

C#

```
public System.Collections.Generic.KeyValuePair<int,object>[] AddedItems {get;
set;}
```

Remarks

The added items are represented by a KeyValuePair [int,object], where the key is the index where the item was added and the value is the data item itself.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ItemPropertiesChanged Property

Gets or sets a value indicating whether the meta-data of the items contained in the collection was changed (i.e. a property was added/removed to/from the item).

Syntax

Visual Basic (Declaration)

```
Public Property ItemPropertiesChanged As System.Boolean
```

C#

```
public System.bool ItemPropertiesChanged {get; set;}
```

Property Value

`true` if a property was changed; otherwise, `false`.

Remarks

The C1DataGrid uses this information to re-create the auto-generated columns.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

S	CurrentRowProperty	Identifies the CurrentRow dependency property.
S	DragOverColumnStyleProperty	Identifies the DragOverColumnStyle dependency property.
S	DragSourceColumnStyleProperty	Identifies the DragSourceColumnStyle dependency property.
S	DropIndicatorStyleProperty	Identifies the DropIndicatorStyle dependency property.
S	FiltersCombinationProperty	Identifies the FiltersCombination dependency property.
S	FilterStyleProperty	Identifies the FilterStyle dependency property.
S	FocusStyleProperty	Identifies the FocusStyle dependency property.
S	FrozenBottomRowsCountProperty	Identifies the FrozenBottomRowsCount dependency property.
S	FrozenColumnCountProperty	Identifies the FrozenColumnCount dependency property.
S	FrozenTopRowsCountProperty	Identifies the FrozenTopRowsCount dependency property.
S	GridLinesVisibilityProperty	Identifies the GridLinesVisibility dependency property.

S	GroupColumnHeaderStyleProperty	Identifies the GroupColumnHeaderStyle dependency property.
S	GroupingPanelBackgroundProperty	Identifies the GroupingPanelBackground dependency property.
S	GroupingPanelForegroundProperty	Identifies the GroupingPanelForeground dependency property.
S	GroupingPanelStyleProperty	Identifies the GroupingPanelStyle dependency property.
S	GroupRowHeaderStyleProperty	Identifies the GroupRowHeaderStyle dependency property.
S	GroupRowHeightProperty	Identifies the GroupRowHeight dependency property.
S	GroupRowPositionProperty	Identifies the GroupRowPosition dependency property.
S	GroupRowStyleProperty	Identifies the GroupRowStyle dependency property.
S	HeaderBackgroundProperty	Identifies the HeaderBackground dependency property.
S	HeaderForegroundProperty	Identifies the HeaderForeground dependency property.
S	HeadersVisibilityProperty	Identifies the HeadersVisibility dependency property.
S	HorizontalGridLinesBrushProperty	Identifies the HorizontalGridLinesBrush dependency property.
S	HorizontalScrollBarVisibilityProperty	Identifies the HorizontalScrollBarVisibility

		dependency property.
S	IndentWidthProperty	Identifies the IndentWidth dependency property.
S	IsLoadingProperty	Identifies the IsLoading dependency property.
S	IsMouseOverProperty	Identifies the IsMouseOver dependency property.
S	IsReadOnlyProperty	Identifies the IsReadOnly dependency property.
S	ItemsSourceProperty	Identifies the ItemsSource dependency property.
S	LeadingColumnWidthProperty	Identifies the LeadingColumnWidth dependency property.
S	LoadingIndicatorStyleProperty	Identifies the LoadingIndicatorStyle dependency property.
S	MaxColumnWidthProperty	Identifies the MaxColumnWidth dependency property.
S	MaxRowHeightProperty	Identifies the MaxRowHeight dependency property.
S	MinColumnWidthProperty	Identifies the MinColumnWidth dependency property.
S	MinRowHeightProperty	Identifies the MinRowHeight dependency property.
S	MouseOverBrushProperty	Identifies the MouseOverBrush dependency property.

S	NewRowHeaderStyleProperty	Identifies the NewRowHeaderStyle dependency property.
S	NewRowStyleProperty	Identifies the NewRowStyle dependency property.
S	NewRowVisibilityProperty	Identifies the NewRowVisibility dependency property.
S	PressedBrushProperty	Identifies the PressedBrush dependency property.
S	RowBackgroundProperty	Identifies the RowBackground dependency property.
S	RowDetailsTemplateProperty	Identifies the RowDetailsTemplate dependency property.
S	RowDetailsVisibilityModeProperty	Identifies the RowDetailsVisibilityMode dependency property.
S	RowForegroundProperty	Identifies the RowForeground dependency property.
S	RowHeaderStyleProperty	Identifies the RowHeaderStyle dependency property.
S	RowHeaderWidthProperty	Identifies the RowHeaderWidth dependency property.
S	RowHeightProperty	Identifies the RowHeight dependency property.
S	RowStyleProperty	Identifies the RowStyle dependency property.
S	ScrollBarStyleProperty	Identifies the ScrollBarStyle dependency property.

S	ScrollModeProperty	Identifies the ScrollMode dependency property.
S	ScrollPreviewRowTemplateProperty	Identifies the ScrollPreviewRowTemplate dependency property.
S	SelectedBackgroundProperty	Identifies the SelectedBackground dependency property.
S	SelectedIndexProperty	Identifies the SelectedIndex dependency property.
S	SelectedItemProperty	Identifies the SelectedItem dependency property.
S	SelectionModeProperty	Identifies the SelectionMode dependency property.
S	ShowFluidMouseOverProperty	Identifies the ShowFluidMouseOver dependency property.
S	ShowGroupingPanelProperty	Identifies the ShowGroupingPanel dependency property.
S	ShowValidationIndicatorsProperty	Identifies the ShowValidationIndicators dependency property.
S	ShowVerticalFreezingSeparatorProperty	Identifies the ShowVerticalFreezingSeparator dependency property.
S	ValidationBackgroundProperty	Identifies the ValidationBackground dependency property.
S	ValidationForegroundProperty	Identifies the ValidationForeground dependency property.
S	VerticalFreezingSeparatorStyleProperty	Identifies the VerticalFreezingSeparatorStyle

		dependency property.
S	VerticalFreezingSeparatorWidthProperty	Identifies the VerticalFreezingSeparatorWidth dependency property.
S	VerticalGridLinesBrushProperty	Identifies the VerticalGridLinesBrush dependency property.
S	VerticalScrollBarVisibilityProperty	Identifies the VerticalScrollBarVisibility dependency property.
S	VerticalScrollStepProperty	Identifies the VerticalScrollStep dependency property.

Top

Public Properties

	Name	Description
	ActualHeight	(Inherited from System.Windows.FrameworkElement)
	ActualWidth	(Inherited from System.Windows.FrameworkElement)
	AllowDrop	(Inherited from System.Windows.UIElement)
	AlternatingRowBackground	Gets or sets the **System.Windows.Media.Brush** that is used to paint the background of odd-numbered rows.
	AlternatingRowForeground	Gets or sets the **System.Windows.Media.Brush** that is used to paint the foreground of odd-numbered rows.
	AutoGenerateColumns	Gets or sets a value indicating whether columns are created automatically when the ItemsSource property is set.
	Background	(Inherited from System.Windows.Controls.Control)

	BodyRect	Gets the rectangle that represent the area where the rows of the C1DataGrid are rendered. Useful to show adorners on top of the body.
	BorderBrush	(Inherited from System.Windows.Controls.Control)
	BorderThickness	(Inherited from System.Windows.Controls.Control)
	BottomRows	Gets the collection of rows that are placed at the bottom of the item rows.
	CacheMode	(Inherited from System.Windows.UIElement)
	CanUserAddRows	Gets or sets a value indicating whether the user is able to enter new rows by entering the data in each cell of the "new row" typically located at the bottom of the data grid.
	CanUserEditRows	Gets or sets a value indicating whether the user is able to edit the data of the cells.
	CanUserFilter	Gets or sets a value indicating whether the user is able to filter a column by opening the corresponding filter popup in the column header.
	CanUserFreezeColumns	Gets or sets a value indicating which of the freezing separators (currently only Left separator is supported) the user is able to drag in order to change the amount of frozen columns or rows.
	CanUserGroup	Gets or sets a value indicating whether the user is able to change groups by dragging column headers over the grouping area, removing groups pressing the remove button of each grouped column element inside the grouping area, or change the order of the groups clicking the grouped column element itself.

	CanUserRemoveRows	Gets or sets a value indicating whether the user is able to remove rows by pressing Del key.
	CanUserReorderColumns	Gets or sets a value indicating whether the user is able to reorder columns by dragging the corresponding column header.
	CanUserResizeColumns	Gets or sets a value indicating whether the user is able to resize a column by dragging the right border of the column header.
	CanUserResizeRows	Gets or sets a value indicating whether the user is able to resize a row by dragging the bottom border of the row header.
	CanUserSelectByDragging	Gets or sets a value indicating whether dragging over cells panel will select them.
	CanUserSort	Gets or sets a value indicating whether the user is able to sort the data by clicking the column header.
	CanUserToggleDetails	Gets or sets a value indicating whether the user is able to change the visibility of the row details by clicking a toggle button located in the top right corner of the corresponding row header.
	CellStyle	Gets or sets the style that is used when rendering the cells.
	CharacterSpacing	(Inherited from System.Windows.Controls.Control)
	Clip	(Inherited from System.Windows.UIElement)
	ClipboardCopyMode	Gets or sets a value indicating the format of the text that will be copied to the clipboard.
	ClipboardPasteMode	Gets or sets a value indicating the expected format of the

		text that will be copied from the clipboard.
	ColumnHeaderClickAction	Gets or sets which action will be taken when user click a column header. By default the click action will execute a sorting operation, but this behavior can be changed to allow a user to select a whole column by pressing the corresponding column header. Typically used in Excel like scenarios.
	ColumnHeaderHeight	Gets or sets the height in pixels of all the column headers.
	ColumnHeaderOptionsVisibility	Gets or sets a value indicating when the options drop-down of the columns headers will be visible.
	ColumnHeaderStyle	Gets or sets the style that is used when rendering the column headers.
	Columns	Gets the collection of columns currently present in the grid.
	ColumnWidth	Gets or sets the column width for all the columns in the C1DataGrid.
	CurrentCell	Gets or sets the cell that contains the focus inside the C1DataGrid. This cell can be changed by the user when navigating with the keyboard or mouse interaction.
	CurrentColumn	Gets or sets the column that contains the focused cell. This cell is changed automatically as the user navigate among cells with the keyboard or because the mouse interaction.
	CurrentRow	Gets or sets the row that contains the focused cell. This cell is changed automatically as the user navigate among cells with the keyboard or because the mouse interaction.

	Cursor	(Inherited from System.Windows.FrameworkElement)
	DataContext	(Inherited from System.Windows.FrameworkElement)
	DataSourceView	Gets the data source view currently used by the C1DataGrid.
	DesiredSize	(Inherited from System.Windows.UIElement)
	Dispatcher	(Inherited from System.Windows.DependencyObject)
	DragOverColumnStyle	Gets or sets the style applied to a **System.Windows.Controls.ContentControl** element used to show the dragged column while it moves.
	DragSourceColumnStyle	Gets or sets the style applied to a **System.Windows.Controls.ContentControl** that is placed over the source column when it starts the Drag and Drop operation.
	DropIndicatorStyle	Gets or sets the style applied to a **System.Windows.Controls.ContentControl** element used to indicate the position where the dragged column will be dropped.
	Effect	(Inherited from System.Windows.UIElement)
	FilteredColumns	Gets the collection of columns whose DataGridColumn.FilterState is different from null. This group of columns determine the filtering state of the C1DataGrid.
	FiltersCombination	Gets or sets the logical way the filters are combined among the columns.
	FilterStyle	Gets or sets the Style used for the Filter control container.

	FlowDirection	(Inherited from System.Windows.FrameworkElement)
	Focused	Gets or sets a value indicating whether this C1DataGrid is focused.
	FocusStyle	Gets or sets the style of the **System.Windows.Shapes.Rectangle** used to show the focus on the C1DataGrid.
	FontFamily	(Inherited from System.Windows.Controls.Control)
	FontSize	(Inherited from System.Windows.Controls.Control)
	FontStretch	(Inherited from System.Windows.Controls.Control)
	FontStyle	(Inherited from System.Windows.Controls.Control)
	FontWeight	(Inherited from System.Windows.Controls.Control)
	Foreground	(Inherited from System.Windows.Controls.Control)
	FrozenBottomRowsCount	Gets or sets the number of rows that remain docked to the bottom of the viewport when the user scrolls vertically.
	FrozenColumnCount	Gets or sets the number of columns that remain docked to the left side of the viewport when the user scrolls horizontally.
	FrozenTopRowsCount	Gets or sets the number of rows that remain docked to the top of the viewport when the user scrolls vertically.
	GridLinesVisibility	Gets or sets a value that indicates whether the horizontal or vertical grid lines among cells are displayed or not.
	GroupColumnHeaderStyle	Gets or sets the style that is used when rendering the column headers in the group panel.

	GroupedColumns	Gets the collection of columns whose DataGridColumn.GroupState is different from null. This group of columns determine the grouping state of the C1DataGrid.
	GroupingPanelBackground	Gets or sets the **System.Windows.Media.Brush** that is used to paint the background of the grouping panel that is on top of the datagrid.
	GroupingPanelForeground	Gets or sets the **System.Windows.Media.Brush** that is used to paint the foreground of the grouping panel that is on top of the datagrid.
	GroupingPanelStyle	Gets or sets the **System.Windows.Style** that is set to the grouping panel that is on top of the datagrid.
	GroupRowHeaderStyle	Gets or sets the style of the header of the group row.
	GroupRowHeight	Gets or sets the row height for all rows of type group in the C1DataGrid.
	GroupRowPosition	Gets or sets where the group row will be located relatively to the items of the group.
	GroupRowStyle	Gets or sets the style of the grouping row.
	HeaderBackground	Gets or sets the **System.Windows.Media.Brush** used to paint the background of the headers of the datagrid besides grouping rows, freezing separator, scrollbars and filters.
	HeaderForeground	Gets or sets the **System.Windows.Media.Brush** used to highlight the foreground of the headers of the datagrid besides grouping rows, freezing separator, scrollbars and filters.
	HeadersVisibility	Gets or sets a value that indicates whether column or row

		headers are displayed or not.
	Height	(Inherited from System.Windows.FrameworkElement)
	HorizontalAlignment	(Inherited from System.Windows.FrameworkElement)
	HorizontalContentAlignment	(Inherited from System.Windows.Controls.Control)
	HorizontalGridLinesBrush	Gets or sets the **System.Windows.Media.Brush** used to display the horizontal grid lines.
	HorizontalScrollBarVisibility	Gets or sets a value that indicates how the horizontal scroll bar is displayed.
	IndentWidth	Gets or sets the width in pixels of each indentation level visible when the data is grouped.
	IsAddingNewRowsAllowed	Gets a value indicating whether it is possible to add new rows according to the inner **System.ComponentModel.ICollectionView** and C1DataGrid configuration.
	IsDetailsTogglingAllowed	Gets a value indicating whether it is possible to toggle row details according to the C1DataGrid configuration.
	IsEditingRowsAllowed	Gets a value indicating whether it is possible to edit rows according to the inner **System.ComponentModel.ICollectionView** and C1DataGrid configuration.
	IsEnabled	(Inherited from System.Windows.Controls.Control)
	IsFilteringRowsAllowed	Gets a value indicating whether it is possible to filter rows according to the inner **System.ComponentModel.ICollectionView** and C1DataGrid configuration.

	IsGroupingRowsAllowed	Gets a value indicating whether it is possible to group rows according to the inner **System.ComponentModel.ICollectionView** and C1DataGrid configuration.
	IsHitTestVisible	(Inherited from System.Windows.UIElement)
	IsLoading	Gets or sets a value indicating whether a visual indicator that cover all the data grid template is shown, demonstrating that the data is being loaded.
	IsMouseOver	Returns true if the mouse is over the control.
	IsReadOnly	Gets or sets a value indicating whether the user is able to add remove or modify info from the C1DataGrid.
	IsRemovingRowsAllowed	Gets a value indicating whether it is possible to remove rows according to the inner **System.ComponentModel.ICollectionView** and C1DataGrid configuration.
	IsSortingRowsAllowed	Gets a value indicating whether it is possible to sort rows according to the inner **System.ComponentModel.ICollectionView** and C1DataGrid configuration.
	IsTabStop	(Inherited from System.Windows.Controls.Control)
	Item	Overloaded. Gets the DataGridCell with the specified row and column index.
	ItemsSource	Gets or sets a collection that is used to generate the content of the control.
	Language	(Inherited from System.Windows.FrameworkElement)
	LeadingColumnWidth	Gets or sets the column width for the leading column (that is the empty space between the row headers and the first

		column, only visible when the data grid is grouped).
	LoadingIndicatorStyle	Gets or sets the Style used for the Loading indicator.
	Margin	(Inherited from System.Windows.FrameworkElement)
	MaxColumnWidth	Gets or sets the maximum column width for all the columns in the C1DataGrid.
	MaxHeight	(Inherited from System.Windows.FrameworkElement)
	MaxRowHeight	Gets or sets the maximum row height for all the rows in the C1DataGrid.
	MaxWidth	(Inherited from System.Windows.FrameworkElement)
	MinColumnWidth	Gets or sets the minimum column width for all the columns in the C1DataGrid.
	MinHeight	(Inherited from System.Windows.FrameworkElement)
	MinRowHeight	Gets or sets the minimum row height for all the rows in the C1DataGrid.
	MinWidth	(Inherited from System.Windows.FrameworkElement)
	MouseOverBrush	Gets or sets the **System.Windows.Media.Brush** used to highlight the control when it has the mouse over.
	Name	(Inherited from System.Windows.FrameworkElement)
	NewRowHeaderStyle	Gets or sets the style that is used when rendering the row header for entering new items.
	NewRowStyle	Gets or sets the style that is used when rendering the row for entering new items.
	NewRowVisibility	Gets or sets a value that indicates where the new row will

		be located. If Top is set the new row will be located on top of the data rows, if Bottom is set will be located at the bottom of the data rows.
	Opacity	(Inherited from System.Windows.UIElement)
	OpacityMask	(Inherited from System.Windows.UIElement)
	Padding	(Inherited from System.Windows.Controls.Control)
	Parent	(Inherited from System.Windows.FrameworkElement)
	PressedBrush	Gets or sets the **System.Windows.Media.Brush** used to paint a button when it is pressed.
	Projection	(Inherited from System.Windows.UIElement)
	RenderSize	(Inherited from System.Windows.UIElement)
	RenderTransform	(Inherited from System.Windows.UIElement)
	RenderTransformOrigin	(Inherited from System.Windows.UIElement)
	Resources	(Inherited from System.Windows.FrameworkElement)
	RowBackground	Gets or sets the **System.Windows.Media.Brush** that is used to paint row backgrounds.
	RowDetailsTemplate	Gets or sets the **System.Windows.DataTemplate** used to present the details part of a row.
	RowDetailsVisibilityMode	The details part can be automatically opened when the row is selected, can be always visible, or can be always collapsed.
	RowForeground	Gets or sets the **System.Windows.Media.Brush** that is used to paint row foregrounds.

	RowHeaderStyle	Gets or sets the style that is used when rendering the row headers.
	RowHeaderWidth	Gets or sets the width in pixels of all the row headers.
	RowHeight	Gets or sets the row height for all the data rows in the C1DataGrid.
	Rows	Gets the collection containing all the rows in the grid.
	RowStyle	Gets or sets the style that is used when rendering rows.
	ScrollBarStyle	Gets or sets the style that will be applied to the scrollbars of the data grid.
	ScrollMode	Gets or sets the scroll behavior of the C1DataGrid.
	ScrollPreviewRowTemplate	Gets or sets the **System.Windows.DataTemplate** used as preview of the scrolling row, when using DataGridScrollMode.Deferred as ScrollMode.
	SelectedBackground	Gets or sets the **System.Windows.Media.Brush** used to highlight the control when it is selected.
	SelectedIndex	Gets or sets the index of the selected row.
	SelectedItem	Gets or sets the data item corresponding to the selected row.
	SelectedItems	Gets the collection of selected items.
	Selection	Gets the selection object which allows to query the current selection as well as modifying it.
	SelectionMode	Gets or sets the selection mode of the grid. See DataGridSelectionMode enumeration to get a description of each mode.

	ShowFluidMouseOver	When set to true, hides the mouse over of the rows provides a fluid mouse effect over the body of the C1DataGrid. Uses the FluidMouseOverBrush and the RowHeight.
	ShowGroupingPanel	Gets or sets a value indicating whether the panel above the cells area used to group by a column is displayed.
	ShowValidationIndicators	Gets or sets a value indicating whether the validation icon will appear inside the corresponding row header as well as the background of the row with errors is turned to red.
	ShowVerticalFreezingSeparator	Gets or sets a value indicating which of the freezing separators (currently only Left separator is supported) is visible.
	SortedColumns	Gets the collection of columns whose DataGridColumn.SortState is different from null. This group of columns determine the sorting state of the C1DataGrid.
	Style	(Inherited from System.Windows.FrameworkElement)
	TabIndex	(Inherited from System.Windows.Controls.Control)
	TabNavigation	(Inherited from System.Windows.Controls.Control)
	Tag	(Inherited from System.Windows.FrameworkElement)
	Template	(Inherited from System.Windows.Controls.Control)
	TopRows	Gets the collection of rows that are placed on top of the item rows.
	Triggers	(Inherited from System.Windows.FrameworkElement)
	UseLayoutRounding	(Inherited from System.Windows.UIElement)

	ValidationBackground	Gets or sets the brush used to paint the background of the validation elements.
	ValidationForeground	Gets or sets the brush used to paint the foreground of the validation elements.
	VerticalAlignment	(Inherited from System.Windows.FrameworkElement)
	VerticalContentAlignment	(Inherited from System.Windows.Controls.Control)
	VerticalFreezingSeparatorStyle	Gets or sets the style of the separator between fixed and scrollable columns.
	VerticalFreezingSeparatorWidth	Gets or sets the width in pixels of the vertical freezing separator.
	VerticalGridLinesBrush	Gets or sets the **System.Windows.Media.Brush** used to display the vertical grid lines.
	VerticalScrollBarVisibility	Gets or sets a value that indicates how the vertical scroll bar is displayed.
	VerticalScrollStep	Gets a value indicating how the vertical scroll behaves when user press the up/down buttons of the vertical scroll bar or when the user uses the mouse wheel. This property is useful when the detail of the rows is too big, typically used in hierarchical scenarios.
	Viewport	Gets useful information about the scrolling state as well as current top/left or bottom/right shown cells.
	Visibility	(Inherited from System.Windows.UIElement)
	Width	(Inherited from System.Windows.FrameworkElement)

Top

Public Methods

	Name	Description
	AddHandler	(Inherited from System.Windows.UIElement)
	ApplyTemplate	(Inherited from System.Windows.Controls.Control)
	Arrange	(Inherited from System.Windows.UIElement)
	BeginEdit	Overloaded. Begins the edit of the currently selected cell.
	BeginNewRow	Begins the edit of a new row. It will scroll the new row into view.
	CancelEdit	Cancels the edit of the currently editing cell.
	CaptureMouse	(Inherited from System.Windows.UIElement)
	ClearValue	(Inherited from System.Windows.DependencyObject)
	EndEdit	Overloaded. Ends the edit of the currently editing cell committing the changes.
	EndEditRow	Ends the edit of the currently editing row.
	EndNewRow	Ends the edit of the new row.
	FilterBy	Overloaded. Sorts the data by the specified column and direction.
	FindName	(Inherited from System.Windows.FrameworkElement)
	Focus	(Inherited from System.Windows.Controls.Control)
	GetAnimationBaseValue	(Inherited from System.Windows.DependencyObject)
	GetBindingExpression	(Inherited from System.Windows.FrameworkElement)
	GetCell	Gets the cell corresponding to specified row and a column

		indexes.
	GetCellFromFrameworkElement	Gets the corresponding cell from a **System.Windows.FrameworkElement** contained inside the cell.
	GetCellFromPoint	Gets the corresponding cell from a specific point in the screen.
	GetDetailFromPoint	Gets the detail presenter from a specific point in the screen.
	GetPageImages	Overloaded. Gets a list of elements that represent parts of the grid fit for rendering into pages of a document.
	GetValue	(Inherited from System.Windows.DependencyObject)
	GroupBy	Overloaded. Groups the data by the specified column and direction.
	InvalidateArrange	(Inherited from System.Windows.UIElement)
	InvalidateMeasure	(Inherited from System.Windows.UIElement)
	Measure	(Inherited from System.Windows.UIElement)
	MoveColumn	Moves the specified column to the target display index.
	OnApplyTemplate	Overridden. Builds the visual tree for the C1DataGrid control when a new template is applied.
	PageDown	Scrolls a page downward.
	PageUp	Scrolls a page upward.
	Print	Overloaded. Shows Print Dialog and prints the grid.
	ReadLocalValue	(Inherited from System.Windows.DependencyObject)

	Refresh	Recreate all the visual elements of the C1DataGrid.
	ReleaseMouseCapture	(Inherited from System.Windows.UIElement)
	Reload	Reloads the content of the grid by bringing all the information again from the inner **System.ComponentModel.ICollectionView**.
	RemoveHandler	(Inherited from System.Windows.UIElement)
	RemoveRow	Removes a row from the grid from the specified index.
	RemoveRows	Overloaded. Removes a specified collection of rows.
	ScrollIntoView	Overloaded. Scrolls into the view the cell in the intersection of the specified data item and column.
	SetBinding	(Inherited from System.Windows.FrameworkElement)
	SetValue	(Inherited from System.Windows.DependencyObject)
	SortBy	Overloaded. Sorts the data by the specified columns and directions.
	TransformToVisual	(Inherited from System.Windows.UIElement)
	UpdateLayout	(Inherited from System.Windows.UIElement)

Top

Public Events

	Name	Description
	AutoGeneratedColumns	Occurs after all the auto-generated columns are created.
	AutoGeneratingColumn	Occurs when the auto-generated columns are being created.

	BeganEdit	Occurs after a cell began to be edited.
	BeginningEdit	Occurs before a cell begins to be edited.
	BeginningNewRow	Occurs when a new row begins to be edited.
	BeginningRowEdit	Occurs before a row begins to be edited. A row begins to be edited when one cell of the row begins editing and there was not previously editing cells in the row.
	BindingValidationError	(Inherited from System.Windows.FrameworkElement)
	CanceledNewRow	Occurs after the editing of a new row has been canceled.
	CanceledRowEdit	Occurs after a row editing has been canceled.
	CancelingEdit	Occurs before a cell change is canceled.
	CancelingNewRow	Occurs when a new row is canceled.
	CancelingRowEdit	Occurs before a row editing is canceled. A row editing is cancelled when the user press escape. Notice that whether escape is pressed on an editing cell the action will cancel the editing of the cell, if escape is pressed again the changes in the whole row will be reverted.
	ColumnHeaderDragCompleted	Occurs when a column header drag operation finish.
	ColumnHeaderDragDelta	Occurs when a column header is being dragged.
	ColumnHeaderDragStarted	Occurs when a column header drag operation started.
	ColumnReordered	Occurs after a move column operation is committed. The move operation can be started by the user when it drops a column header in a new position or when MoveColumn method is called.

	ColumnReordering	Occurs before a move column operation is committed. The move operation can be started by the user when it drops a column header in a new position or when MoveColumn method is called.
	ColumnResized	Occurs when the user release the mouse after dragging the border on the right of the column header.
	ColumnResizing	Occurs while the user is resizing a column by dragging the border on the right of the column header.
	CommittedEdit	Occurs after a cell editing has been committed.
	CommittedNewRow	Occurs after a new row is committed.
	CommittedRowEdit	Occurs after a row editing has been committed. A row editing is committed when a cell of the row has been previously edited and the current cell is changed to a cell which does not belong to the edited row.
	CommittingEdit	Occurs before a cell change is committed.
	CommittingNewRow	Occurs before a new row is committed, allowing to cancel the action.
	CommittingRowEdit	Occurs before a row editing is committed. A row editing is committed when a cell of the row has been previously edited and the current cell is changed to a cell which does not belong to the edited row.
	CreatingRow	Occurs when a row is being created in the model, so you can override the creation returning a different row type.
	CurrentCellChanged	Occurs when a different cell becomes the current cell. Typically this occurs when a user clicks a cell, but it can be set programmatically too by setting CurrentRow and

		CurrentColumn.
	DataContextChanged	(Inherited from System.Windows.FrameworkElement)
	DeletingRows	Occurs before a deletion of rows happens.
	DragEnter	(Inherited from System.Windows.UIElement)
	DragLeave	(Inherited from System.Windows.UIElement)
	DragOver	(Inherited from System.Windows.UIElement)
	Drop	(Inherited from System.Windows.UIElement)
	FilterChanged	Occurs after the filtering state changed.
	FilterChanging	Occurs before the filter state of C1DataGrid is changed.
	FilterLoading	Occurs before the filter of a column is loaded allowing to change the filter that will be displayed to the user.
	FilterOpened	Occurs when the filter of a column is opened by clicking the button on the right side of the column header.
	FrozenBottomRowsCountChanged	Event raised when the **FrozenBottomRowsCount** property has changed.
	FrozenColumnCountChanged	Event raised when the **FrozenColumnCount** property has changed.
	FrozenTopRowsCountChanged	Event raised when the **FrozenTopRowsCount** property has changed.
	GotFocus	(Inherited from System.Windows.UIElement)
	GroupChanged	Occurs after the grouping state changed.

	GroupChanging	Occurs before the grouping state of the C1DataGrid is changed.
	IsEnabledChanged	(Inherited from System.Windows.Controls.Control)
	IsLoadingChanged	Event raised when the **IsLoading** property has changed.
	IsMouseOverChanged	Event raised when the **IsMouseOver** property has changed.
	KeyDown	Occurs when a keyboard key is pressed while the **System.Windows.UIElement** has focus.
	KeyUp	(Inherited from System.Windows.UIElement)
	LayoutUpdated	(Inherited from System.Windows.FrameworkElement)
	LeadingColumnWidthChanged	Event raised when the **LeadingColumnWidth** property has changed.
	Loaded	(Inherited from System.Windows.FrameworkElement)
	LoadedCellPresenter	Occurs after the visual element of the cell is added to the visual tree and is ready for interaction.
	LoadedColumnHeaderPresenter	Occurs after the column header presenter is added in the visual tree and is ready for interaction.
	LoadedRowDetailsPresenter	Occurs after the visual element of the row details is added in the visual tree and is ready for interaction.
	LoadedRowHeaderPresenter	Occurs after the visual element of the row header is added to the visual tree and is ready for interaction.
	LoadedRowPresenter	Occurs after the visual element of the row is added in the visual tree and is ready for interaction.

	LoadingRow	Occurs when a data item is being loaded in the model This might happen both by bringing the row into view or requesting the row programmatically.
	LostFocus	(Inherited from System.Windows.UIElement)
	LostMouseCapture	(Inherited from System.Windows.UIElement)
	MediaCommand	(Inherited from System.Windows.UIElement)
	MergingCells	Occurs after the measuring the cells, so that the user can combine adjacent cells. In order to merge the cells you should call the method Merge of the DataGridMergingCellsEventArgs passed in.
	MouseEnter	(Inherited from System.Windows.UIElement)
	MouseLeave	(Inherited from System.Windows.UIElement)
	MouseLeftButtonDown	(Inherited from System.Windows.UIElement)
	MouseLeftButtonUp	(Inherited from System.Windows.UIElement)
	MouseMove	(Inherited from System.Windows.UIElement)
	MouseRightButtonDown	(Inherited from System.Windows.UIElement)
	MouseRightButtonUp	(Inherited from System.Windows.UIElement)
	MouseWheel	(Inherited from System.Windows.UIElement)
	PropertyChanged	Occurs when a property value changes.
	RowDetailsVisibilityChanged	Occurs when the visibility of a row details changed.
	RowResized	Occurs when the user release the mouse after dragging the border at the bottom of the column header.

	RowResizing	Occurs while the user is resizing a row by dragging the border at the bottom of the row header.
	RowsAdded	Occurs after new rows have been added to the C1DataGrid.
	RowsDeleted	Occurs after rows have been deleted from the C1DataGrid.
	SelectionChanged	Occurs when the SelectedItem or SelectedItems property value changes.
	SelectionChanging	Occurs before the selection changes.
	SelectionDragCompleted	Occurs when the mouse drag operation in the area containing the rows is completed.
	SelectionDragDelta	Occurs when the mouse is being dragged in the area containing the rows.
	SelectionDragStarted	Occurs the first time the mouse is dragged in the area containing the rows.
	SizeChanged	(Inherited from System.Windows.FrameworkElement)
	SortChanged	Occurs after the sorting state changed.
	SortChanging	Occurs before the sorting state of C1DataGrid is changed.
	TextInput	(Inherited from System.Windows.UIElement)
	TextInputStart	(Inherited from System.Windows.UIElement)
	TextInputUpdate	(Inherited from System.Windows.UIElement)
	Unloaded	(Inherited from System.Windows.FrameworkElement)

	UnloadedCellPresenter	Occurs before the visual element of a cell is removed from the visual tree.
	UnloadedColumnHeaderPresenter	Occurs before the visual element of a column header is removed from the visual tree.
	UnloadedRowDetailsPresenter	Occurs before the visual element of a row details is removed from the visual tree.
	UnloadedRowHeaderPresenter	Occurs before the visual element of a row header is removed from the visual tree.
	UnloadedRowPresenter	Occurs before the visual element of a row is removed from the visual tree.
	UnloadingRow	Occurs after a row is unloaded from the model.

C1DataGrid Class
C1.Silverlight.DataGrid Namespace

C1DataGrid Constructor

Initializes a new instance of a C1DataGrid.

Syntax

Visual Basic (Declaration)

```
Public Function New()
```

C#

```
public C1DataGrid()
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Public Methods

	Name	Description
	AddHandler	(Inherited from System.Windows.UIElement)
	ApplyTemplate	(Inherited from System.Windows.Controls.Control)
	Arrange	(Inherited from System.Windows.UIElement)
	BeginEdit	Overloaded. Begins the edit of the currently selected cell.
	BeginNewRow	Begins the edit of a new row. It will scroll the new row into view.
	CancelEdit	Cancels the edit of the currently editing cell.
	CaptureMouse	(Inherited from System.Windows.UIElement)
	ClearValue	(Inherited from System.Windows.DependencyObject)
	EndEdit	Overloaded. Ends the edit of the currently editing cell committing the changes.

	EndEditRow	Ends the edit of the currently editing row.
	EndNewRow	Ends the edit of the new row.
	FilterBy	Overloaded. Sorts the data by the specified column and direction.
	FindName	(Inherited from System.Windows.FrameworkElement)
	Focus	(Inherited from System.Windows.Controls.Control)
	GetAnimationBaseValue	(Inherited from System.Windows.DependencyObject)
	GetBindingExpression	(Inherited from System.Windows.FrameworkElement)
	GetCell	Gets the cell corresponding to specified row and a column indexes.
	GetCellFromFrameworkElement	Gets the corresponding cell from a **System.Windows.FrameworkElement** contained inside the cell.
	GetCellFromPoint	Gets the corresponding cell from a specific point in the screen.
	GetDetailFromPoint	Gets the detail presenter from a specific point in the screen.
	GetPageImages	Overloaded. Gets a list of elements that represent parts of the grid fit for rendering into pages of a document.
	GetValue	(Inherited from System.Windows.DependencyObject)
	GroupBy	Overloaded. Groups the data by the specified column and direction.
	InvalidateArrange	(Inherited from System.Windows.UIElement)

	InvalidateMeasure	(Inherited from System.Windows.UIElement)
	Measure	(Inherited from System.Windows.UIElement)
	MoveColumn	Moves the specified column to the target display index.
	OnApplyTemplate	Overridden. Builds the visual tree for the C1DataGrid control when a new template is applied.
	PageDown	Scrolls a page downward.
	PageUp	Scrolls a page upward.
	Print	Overloaded. Shows Print Dialog and prints the grid.
	ReadLocalValue	(Inherited from System.Windows.DependencyObject)
	Refresh	Recreate all the visual elements of the C1DataGrid.
	ReleaseMouseCapture	(Inherited from System.Windows.UIElement)
	Reload	Reloads the content of the grid by bringing all the information again from the inner **System.ComponentModel.ICollectionView**.
	RemoveHandler	(Inherited from System.Windows.UIElement)
	RemoveRow	Removes a row from the grid from the specified index.
	RemoveRows	Overloaded. Removes a specified collection of rows.
	ScrollIntoView	Overloaded. Scrolls into the view the cell in the intersection of the specified data item and column.
	SetBinding	(Inherited from System.Windows.FrameworkElement)
	SetValue	(Inherited from System.Windows.DependencyObject)

	SortBy	Overloaded. Sorts the data by the specified columns and directions.
	TransformToVisual	(Inherited from System.Windows.UIElement)
	UpdateLayout	(Inherited from System.Windows.UIElement)

BeginEdit Method

Begins the edit of the currently selected cell.

Overload List

Overload	Description
BeginEdit()	Begins the edit of the currently selected cell.
BeginEdit(Int32,Int32)	Begins the edit of the cell in the specified row and column indexes.
BeginEdit(DataGridCell)	Begins the edit of the specified cell.
BeginEdit(RoutedEventArgs)	Begins the edit of the currently selected cell.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

BeginEdit(Int32,Int32) Method
Index of the row.

Index of the column.

Begins the edit of the cell in the specified row and column indexes.

Syntax

Visual Basic (Declaration)

```
Public Overloads Function BeginEdit( _
   ByVal rowIndex As System.Integer, _
   ByVal columnIndex As System.Integer _
```

```
) As System.Boolean
```

C#

```
public System.bool BeginEdit(
   System.int rowIndex,
   System.int columnIndex
)
```

Parameters

rowIndex

Index of the row.

columnIndex

Index of the column.

Return Value

True, if the edit began, otherwise False

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

BeginEdit(RoutedEventArgs) Method
The **System.Windows.RoutedEventArgs** instance containing the event data.

Begins the edit of the currently selected cell.

Syntax

Visual Basic (Declaration)

```
Public Overloads Function BeginEdit( _
   ByVal editingEventArgs As System.Windows.RoutedEventArgs _
) As System.Boolean
```

C#

```
public System.bool BeginEdit(
```

```
   System.Windows.RoutedEventArgs editingEventArgs
)
```

Parameters

editingEventArgs

The **System.Windows.RoutedEventArgs** instance containing the event data.

Return Value

True, if the edit began, otherwise False

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

FilterBy Method

Sorts the data by the specified column and direction.

Overload List

Overload	Description
FilterBy(DataGridColumn,DataGridFilterState)	Sorts the data by the specified column and direction.
FilterBy(DataGridColumn,DataGridFilterState,Boolean)	Sorts the data by the specified column and direction.

FilterBy(KeyValuePair<DataGridColumn,DataGridFilterState>[])	Filters the data by the specified columns and filter states.
FilterBy(DataGridColumnValue<DataGridFilterState>[])	Filters the data by the specified columns and filter states.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

FilterBy(DataGridColumn,DataGridFilterState) Method
The column that will be ordered.

State of the filter.

Sorts the data by the specified column and direction.

Syntax

Visual Basic (Declaration)

```
Public Overloads Sub FilterBy( _
   ByVal column As DataGridColumn, _
   ByVal filterState As DataGridFilterState _
)
```

C#

```
public void FilterBy(
   DataGridColumn column,
   DataGridFilterState filterState
)
```

Parameters

column

The column that will be ordered.

filterState

State of the filter.

Exceptions

Exception	Description
DataGridFilterException	This exception is raised whether the collection view is not ready to filter.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

FilterBy(DataGridColumn,DataGridFilterState,Boolean) Method
The column that will be ordered.

State of the filter.

If true, keeps previous filtered columns

Sorts the data by the specified column and direction.

Syntax

Visual Basic (Declaration)

```
Public Overloads Sub FilterBy( _
   ByVal column As DataGridColumn, _
   ByVal filterState As DataGridFilterState, _
   ByVal preservePreviousFilters As System.Boolean _
)
```

C#

```
public void FilterBy(
   DataGridColumn column,
   DataGridFilterState filterState,
   System.bool preservePreviousFilters
)
```

Parameters

column

The column that will be ordered.

filterState

State of the filter.

preservePreviousFilters

If true, keeps previous filtered columns

Exceptions

Exception	Description
DataGridFilterException	This exception is raised whether the collection view is not ready to filter.

GetCell Method

Index of the row.

Index of the column.

Gets the cell corresponding to specified row and a column indexes.

Syntax

Visual Basic (Declaration)

```
Public Function GetCell( _
   ByVal rowIndex As System.Integer, _
   ByVal columnIndex As System.Integer _
) As DataGridCell
```

C#

```
public DataGridCell GetCell(
   System.int rowIndex,
   System.int columnIndex
)
```

Parameters

rowIndex

Index of the row.

columnIndex

Index of the column.

Return Value

The cell in the specified row and column indexes

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

GetCellFromFrameworkElement Method

The element inside the cell.

Gets the corresponding cell from a **System.Windows.FrameworkElement** contained inside the cell.

Syntax

Visual Basic (Declaration)

```
Public Function GetCellFromFrameworkElement( _
   ByVal element As System.Windows.FrameworkElement _
) As DataGridCell
```

C#

```
public DataGridCell GetCellFromFrameworkElement(
   System.Windows.FrameworkElement element
)
```

Parameters

element

The element inside the cell.

Return Value

The cell that contains the **System.Windows.FrameworkElement**

Remarks

This methods walks the visual tree from the passed in element searching for a DataGridCellPresenter.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GetCellFromPoint Method

The point in the coordinate system where the hit test is to be performed.

Gets the corresponding cell from a specific point in the screen.

Syntax

Visual Basic (Declaration)

```
Public Function GetCellFromPoint( _
   ByVal point As System.Windows.Point _
) As DataGridCell
```

C#

```
public DataGridCell GetCellFromPoint(
   System.Windows.Point point
)
```

Parameters

point

The point in the coordinate system where the hit test is to be performed.

Return Value

The cell in that point of the screen

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GetDetailFromPoint Method

The point in the screen coordinates.

Gets the detail presenter from a specific point in the screen.

Syntax

Visual Basic (Declaration)

```
Public Function GetDetailFromPoint( _
   ByVal point As System.Windows.Point _
) As DataGridDetailsPresenter
```

C#

```
public DataGridDetailsPresenter GetDetailFromPoint(
   System.Windows.Point point
)
```

Parameters

point

The point in the screen coordinates.

Return Value

The detail presenter from a specific point in the screen

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GetPageImages(ScaleMode,Size,Thickness,Int32,Int32) Method
How to scale the document to fit the pages.

Size of the pages in pixels.

Margin around the page in pixels.

The maximum number of pages to print.

Returns the number of vertical pages. Note that if C1DataGrid width doesn't fit to the specified page width, each vertical page is additionally split horizontally to subpages that fit to the specified width, so one vertical page is represented by multiple items in the collection returned by this method. This out parameter returns the number of vertical pages, that doesn't take into account horizontal splits. The number of horizontal subpages for each vertical page can be calculated by dividing the number of items returned by this method by the value returned in the verticalPageCount parameter.

Gets a list of elements that represent parts of the grid fit for rendering into pages of a document.

Syntax

Visual Basic (Declaration)

```
Public Overloads Function GetPageImages( _
   ByVal scaleMode As ScaleMode, _
   ByVal pageSize As System.Windows.Size, _
   ByVal margin As System.Windows.Thickness, _
```

```
   ByVal maxPages As System.Integer, _
   ByRef verticalPageCount As System.Integer _
) As System.Collections.Generic.List(Of FrameworkElement)
```

C#

```
public System.Collections.Generic.List<FrameworkElement> GetPageImages(
   ScaleMode scaleMode,
   System.Windows.Size pageSize,
   System.Windows.Thickness margin,
   System.int maxPages,
   out System.int verticalPageCount
)
```

Parameters

scaleMode

How to scale the document to fit the pages.

pageSize

Size of the pages in pixels.

margin

Margin around the page in pixels.

maxPages

The maximum number of pages to print.

verticalPageCount

Returns the number of vertical pages. Note that if C1DataGrid width doesn't fit to the specified page width, each vertical page is additionally split horizontally to subpages that fit to the specified width, so one vertical page is represented by multiple items in the collection returned by this method. This out parameter returns the number of vertical pages, that doesn't take into account horizontal splits. The number of horizontal subpages for each vertical page can be calculated by dividing the number of items returned by this method by the value returned in the verticalPageCount parameter.

Return Value

A list with elements that correspond to the pages.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows

Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Overload List

GetPageImages(ScaleMode,Size,Thickness,Int32,Boolean,Int32) Method
How to scale the document to fit the pages.

Size of the pages in pixels.

Margin around the page in pixels.

The maximum number of pages to print.

Indicates whether page info like a page number/count should be added to the generated images.

Returns the number of vertical pages. Note that if C1DataGrid width doesn't fit to the specified page width, each vertical page is additionally split horizontally to subpages that fit to the specified width, so one vertical page is represented by multiple items in the collection returned by this method. This out parameter returns the number of vertical pages, that doesn't take into account horizontal splits. The number of horizontal subpages for each vertical page can be calculated by dividing the number of items returned by this method by the value returned in the verticalPageCount parameter.

Gets a list of elements that represent parts of the grid fit for rendering into pages of a document.

Syntax

Visual Basic (Declaration)

```
Public Overloads Function GetPageImages( _
   ByVal scaleMode As ScaleMode, _
   ByVal pageSize As System.Windows.Size, _
   ByVal margin As System.Windows.Thickness, _
   ByVal maxPages As System.Integer, _
   ByVal showPageInfo As System.Boolean, _
   ByRef verticalPageCount As System.Integer _
) As System.Collections.Generic.List(Of FrameworkElement)
```

C#

```
public System.Collections.Generic.List<FrameworkElement> GetPageImages(
   ScaleMode scaleMode,
   System.Windows.Size pageSize,
   System.Windows.Thickness margin,
   System.int maxPages,
   System.bool showPageInfo,
   out System.int verticalPageCount
)
```

Parameters

scaleMode

How to scale the document to fit the pages.

pageSize

Size of the pages in pixels.

margin

Margin around the page in pixels.

maxPages

The maximum number of pages to print.

showPageInfo

Indicates whether page info like a page number/count should be added to the generated images.

verticalPageCount

Returns the number of vertical pages. Note that if C1DataGrid width doesn't fit to the specified page width, each vertical page is additionally split horizontally to subpages that fit to the specified width, so one vertical page is represented by multiple items in the collection returned by this method. This out parameter returns the number of vertical pages, that doesn't take into account horizontal splits. The number of horizontal subpages for each vertical page can be calculated by dividing the number of items returned by this method by the value returned in the verticalPageCount parameter.

Return Value

A list with elements that correspond to the pages.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GroupBy(DataGridColumn,DataGridSortDirection) Method
The column that will be grouped by.

The order of the group.

Groups the data by the specified column and direction.

Syntax

Visual Basic (Declaration)

```
Public Overloads Sub GroupBy( _
   ByVal column As DataGridColumn, _
   ByVal direction As DataGridSortDirection _
)
```

C#

```
public void GroupBy(
   DataGridColumn column,
   DataGridSortDirection direction
)
```

Parameters

column

The column that will be grouped by.

direction

The order of the group.

Exceptions

Exception	Description

DataGridGroupException	This exception is raised whether the collection view is not ready to execute a group operation.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Overload List

GroupBy(DataGridColumn,DataGridSortDirection,Boolean) Method
The column that will be grouped by.

The order of the group.

If true, the other columns will preserve the current state.

Groups the data by the specified column and direction.

Syntax

Visual Basic (Declaration)

```
Public Overloads Sub GroupBy( _
   ByVal column As DataGridColumn, _
   ByVal direction As DataGridSortDirection, _
   ByVal preserveOtherColumnsGrouping As System.Boolean _
)
```

C#

```
public void GroupBy(
   DataGridColumn column,
   DataGridSortDirection direction,
   System.bool preserveOtherColumnsGrouping
)
```

Parameters

column

The column that will be grouped by.

direction

The order of the group.

preserveOtherColumnsGrouping

If true, the other columns will preserve the current state.

Exceptions

Exception	Description
DataGridGroupException	This exception is raised whether the collection view is not ready to execute a group operation.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GroupBy(DataGridColumn[]) Method
The columns that will be grouped by.

Groups the data by the specified columns in Ascending direction.

Syntax

Visual Basic (Declaration)

```
Public Overloads Sub GroupBy( _
   ByVal ParamArray columns() As DataGridColumn _
)
```

C#

```
public void GroupBy(
```

```
   params DataGridColumn[] columns
)
```

Parameters

columns

The columns that will be grouped by.

Exceptions

Exception	Description
DataGridGroupException	This exception is raised whether the collection view is not ready to execute a group operation.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

MoveColumn Method

The column to move.

Target display index of the column.

Moves the specified column to the target display index.

Syntax

Visual Basic (Declaration)

```
Public Sub MoveColumn( _
   ByVal column As DataGridColumn, _
```

```
   ByVal targetDisplayIndex As System.Integer _
)
```

C#

```
public void MoveColumn(
   DataGridColumn column,
   System.int targetDisplayIndex
)
```

Parameters

column

The column to move.

targetDisplayIndex

Target display index of the column.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

OnApplyTemplate Method

Builds the visual tree for the C1DataGrid control when a new template is applied.

Syntax

Visual Basic (Declaration)

```
Public Overrides Sub OnApplyTemplate()
```

C#

```
public override void OnApplyTemplate()
```

Remarks

This method is invoked whenever application code or an internal process, such as a rebuilding layout pass, calls the **ApplyTemplate** method.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

PageDown Method
if set to `true` changes the selected row.

Scrolls a page downward.

Syntax

Visual Basic (Declaration)

```
Public Function PageDown( _
   ByVal changeSelection As System.Boolean _
) As System.Boolean
```

C#

```
public System.bool PageDown(
   System.bool changeSelection
)
```

Parameters

changeSelection

if set to `true` changes the selected row.

Return Value

true, if the scroll occurs

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

   ByVal changeSelection As System.Boolean _
) As System.Boolean
```

C#

```
public System.bool PageUp(
   System.bool changeSelection
)
```

Parameters

changeSelection

if set to `true` changes the selected row.

Return Value

true, if the scroll occurs

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Print Method
Shows Print Dialog and prints the grid.

Overload List

Overload	Description
Print(String)	Shows Print Dialog and prints the grid.
Print(String,ScaleMode,Thickness,Int32)	Prints the grid using a specified scale mode.
Print(String,PrinterFallbackSettings,Boolean)	Prints the grid.
Print(String,ScaleMode,Thickness,Int32,PrinterFallbackSettings,Boolean)	Prints the grid using a specified scale mode.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Print(String) Method
Name of the document to print.

Shows Print Dialog and prints the grid.

Syntax

Visual Basic (Declaration)	

```
Public Overloads Sub Print( _
   ByVal documentName As System.String _
)
```

C#

```
public void Print(
   System.string documentName
)
```

Parameters

documentName

Name of the document to print.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Overload List

Print(String,ScaleMode,Thickness,Int32) Method
Name of the document to print.

How to scale the document to fit the pages.

Margin around the page in pixels.

The maximum number of pages to print.

Prints the grid using a specified scale mode.

Syntax

Visual Basic (Declaration)

```
Public Overloads Sub Print( _
   ByVal documentName As System.String, _
   ByVal scaleMode As ScaleMode, _
```

```
    ByVal margin As System.Windows.Thickness, _
    ByVal maxPages As System.Integer _
)
```

C#

```
public void Print(
    System.string documentName,
    ScaleMode scaleMode,
    System.Windows.Thickness margin,
    System.int maxPages
)
```

Parameters

documentName

Name of the document to print.

scaleMode

How to scale the document to fit the pages.

margin

Margin around the page in pixels.

maxPages

The maximum number of pages to print.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Overload List

Print(String,PrinterFallbackSettings,Boolean) Method
Name of the document to print.

The settings to use to enable vector printing for printers with limited support.

Whether or not to automatically print to the default printer for the computer without showing a print dialog. This parameter can only be true in trusted applications, otherwise an exception will occur.

Prints the grid.

Syntax

Visual Basic (Declaration)

```
Public Overloads Sub Print( _
   ByVal documentName As System.String, _
   ByVal fallBackSettings As System.Windows.Printing.PrinterFallbackSettings,
_
   ByVal useDefaultPrinter As System.Boolean _
)
```

C#

```
public void Print(
   System.string documentName,
   System.Windows.Printing.PrinterFallbackSettings fallBackSettings,
   System.bool useDefaultPrinter
)
```

Parameters

documentName

Name of the document to print.

fallBackSettings

The settings to use to enable vector printing for printers with limited support.

useDefaultPrinter

Whether or not to automatically print to the default printer for the computer without showing a print dialog. This parameter can only be true in trusted applications, otherwise an exception will occur.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Overload List

Refresh Method

When set to true keeps the current ui elements in order to be used in next layout pass.

if set to `true` refreshes row presenters.

if set to `true` refreshes cell presenters.

if set to `true` refreshes column headers presenters.

if set to `true` refreshes row header presenters.

Recreate all the visual elements of the C1DataGrid.

Syntax

Visual Basic (Declaration)

```
Public Sub Refresh( _
   Optional ByVal recycle As System.Boolean, _
   Optional ByVal refreshRows As System.Boolean, _
   Optional ByVal refreshCells As System.Boolean, _
   Optional ByVal refreshColumnHeaders As System.Boolean, _
   Optional ByVal refreshRowHeaders As System.Boolean _
)
```

C#

```
public void Refresh(
   System.bool recycle,
   System.bool refreshRows,
   System.bool refreshCells,
   System.bool refreshColumnHeaders,
   System.bool refreshRowHeaders
)
```

Parameters

recycle

When set to true keeps the current ui elements in order to be used in next layout pass.

refreshRows

if set to `true` refreshes row presenters.

refreshCells

if set to `true` refreshes cell presenters.

refreshColumnHeaders

if set to `true` refreshes column headers presenters.

refreshRowHeaders

if set to `true` refreshes row header presenters.

Remarks

The creation of the elements is delegated to the Silverlight layout mechanism, so if you query a visual element after calling this method (e.g. grid[0,0].Presenter) it will return nothing, if you need to access the elements you will need to call **FrameworkElement.UpdateLayout** method to force Silverlight layout to pass.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reload Method

If true, the columns will be reloaded, otherwise the columns won't be reloaded

Reloads the content of the grid by bringing all the information again from the inner **System.ComponentModel.ICollectionView**.

Syntax

Visual Basic (Declaration)

```
Public Function Reload( _
   ByVal createColumns As System.Boolean _
) As System.Boolean
```

C#

```
public System.bool Reload(
   System.bool createColumns
)
```

Parameters

createColumns

If true, the columns will be reloaded, otherwise the columns won't be reloaded

Remarks

This method is typically used when the data source changed in an unnoticeable way to the C1DataGrid. e.g. when the ItemsSource is a **List** and a row is added directly to the list.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

RemoveRow Method

Index of the row to remove.

Removes a row from the grid from the specified index.

Syntax

Visual Basic (Declaration)

```
Public Function RemoveRow( _
   ByVal rowIndex As System.Integer _
) As System.Boolean
```

C#

```
public System.bool RemoveRow(
   System.int rowIndex
)
```

Parameters

rowIndex

Index of the row to remove.

Return Value

True, If the row was removed

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

RemoveRows(DataGridRow[]) Method

The rows to remove.

Removes a specified collection of rows.

Syntax

Visual Basic (Declaration)	

```
Public Overloads Function RemoveRows( _
```

```
   ByVal removedRows() As DataGridRow _
) As System.Boolean
```

C#

```
public System.bool RemoveRows(
   DataGridRow[] removedRows
)
```

Parameters

removedRows

The rows to remove.

Return Value

True, if the rows were removed

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

RemoveRows(Int32[]) Method
The row indexes to be removed.

Removes a collection of rows from a collection of row indexes.

Syntax

Visual Basic (Declaration)

```
Public Overloads Function RemoveRows( _
   ByVal rowIndexes() As System.Integer _
) As System.Boolean
```

C#

```
public System.bool RemoveRows(
   System.int[] rowIndexes
)
```

Parameters

rowIndexes

The row indexes to be removed.

Return Value

True, if the rows were removed

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ScrollIntoView(Object,DataGridColumn) Method
The item.

The column.

Scrolls into the view the cell in the intersection of the specified data item and column.

Syntax

Visual Basic (Declaration)

```
Public Overloads Sub ScrollIntoView( _
   ByVal item As System.Object, _
   ByVal column As DataGridColumn _
)
```

C#

```
public void ScrollIntoView(
   System.object item,
   DataGridColumn column
)
```

Parameters

item

The item.

column

The column.

Remarks

If the cell is already inside the viewport nothing happens.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

	ActualHeight	(Inherited from System.Windows.FrameworkElement)
	ActualWidth	(Inherited from System.Windows.FrameworkElement)
	AllowDrop	(Inherited from System.Windows.UIElement)
	AlternatingRowBackground	Gets or sets the **System.Windows.Media.Brush** that is used to paint the background of odd-numbered rows.
	AlternatingRowForeground	Gets or sets the **System.Windows.Media.Brush** that is used to paint the foreground of odd-numbered rows.
	AutoGenerateColumns	Gets or sets a value indicating whether columns are created automatically when the ItemsSource property is

		set.
	Background	(Inherited from System.Windows.Controls.Control)
	BodyRect	Gets the rectangle that represent the area where the rows of the C1DataGrid are rendered. Useful to show adorners on top of the body.
	BorderBrush	(Inherited from System.Windows.Controls.Control)
	BorderThickness	(Inherited from System.Windows.Controls.Control)
	BottomRows	Gets the collection of rows that are placed at the bottom of the item rows.
	CacheMode	(Inherited from System.Windows.UIElement)
	CanUserAddRows	Gets or sets a value indicating whether the user is able to enter new rows by entering the data in each cell of the "new row" typically located at the bottom of the data grid.
	CanUserEditRows	Gets or sets a value indicating whether the user is able to edit the data of the cells.
	CanUserFilter	Gets or sets a value indicating whether the user is able to filter a column by opening the corresponding filter popup in the column header.
	CanUserFreezeColumns	Gets or sets a value indicating which of the freezing separators (currently only Left separator is supported) the user is able to drag in order to change the amount of frozen columns or rows.
	CanUserGroup	Gets or sets a value indicating whether the user is able to change groups by dragging column headers over the grouping area, removing groups pressing the remove button of each grouped column element inside the

		grouping area, or change the order of the groups clicking the grouped column element itself.
	CanUserRemoveRows	Gets or sets a value indicating whether the user is able to remove rows by pressing Del key.
	CanUserReorderColumns	Gets or sets a value indicating whether the user is able to reorder columns by dragging the corresponding column header.
	CanUserResizeColumns	Gets or sets a value indicating whether the user is able to resize a column by dragging the right border of the column header.
	CanUserResizeRows	Gets or sets a value indicating whether the user is able to resize a row by dragging the bottom border of the row header.
	CanUserSelectByDragging	Gets or sets a value indicating whether dragging over cells panel will select them.
	CanUserSort	Gets or sets a value indicating whether the user is able to sort the data by clicking the column header.
	CanUserToggleDetails	Gets or sets a value indicating whether the user is able to change the visibility of the row details by clicking a toggle button located in the top right corner of the corresponding row header.
	CellStyle	Gets or sets the style that is used when rendering the cells.
	CharacterSpacing	(Inherited from System.Windows.Controls.Control)
	Clip	(Inherited from System.Windows.UIElement)
	ClipboardCopyMode	Gets or sets a value indicating the format of the text that

		will be copied to the clipboard.
	ClipboardPasteMode	Gets or sets a value indicating the expected format of the text that will be copied from the clipboard.
	ColumnHeaderClickAction	Gets or sets which action will be taken when user click a column header. By default the click action will execute a sorting operation, but this behavior can be changed to allow a user to select a whole column by pressing the corresponding column header. Typically used in Excel like scenarios.
	ColumnHeaderHeight	Gets or sets the height in pixels of all the column headers.
	ColumnHeaderOptionsVisibility	Gets or sets a value indicating when the options drop-down of the columns headers will be visible.
	ColumnHeaderStyle	Gets or sets the style that is used when rendering the column headers.
	Columns	Gets the collection of columns currently present in the grid.
	ColumnWidth	Gets or sets the column width for all the columns in the C1DataGrid.
	CurrentCell	Gets or sets the cell that contains the focus inside the C1DataGrid. This cell can be changed by the user when navigating with the keyboard or mouse interaction.
	CurrentColumn	Gets or sets the column that contains the focused cell. This cell is changed automatically as the user navigate among cells with the keyboard or because the mouse interaction.
	CurrentRow	Gets or sets the row that contains the focused cell. This cell is changed automatically as the user navigate among

		cells with the keyboard or because the mouse interaction.
	Cursor	(Inherited from System.Windows.FrameworkElement)
	DataContext	(Inherited from System.Windows.FrameworkElement)
	DataSourceView	Gets the data source view currently used by the C1DataGrid.
	DesiredSize	(Inherited from System.Windows.UIElement)
	Dispatcher	(Inherited from System.Windows.DependencyObject)
	DragOverColumnStyle	Gets or sets the style applied to a **System.Windows.Controls.ContentControl** element used to show the dragged column while it moves.
	DragSourceColumnStyle	Gets or sets the style applied to a **System.Windows.Controls.ContentControl** that is placed over the source column when it starts the Drag and Drop operation.
	DropIndicatorStyle	Gets or sets the style applied to a **System.Windows.Controls.ContentControl** element used to indicate the position where the dragged column will be dropped.
	Effect	(Inherited from System.Windows.UIElement)
	FilteredColumns	Gets the collection of columns whose DataGridColumn.FilterState is different from null. This group of columns determine the filtering state of the C1DataGrid.
	FiltersCombination	Gets or sets the logical way the filters are combined among the columns.

	FilterStyle	Gets or sets the Style used for the Filter control container.
	FlowDirection	(Inherited from System.Windows.FrameworkElement)
	Focused	Gets or sets a value indicating whether this C1DataGrid is focused.
	FocusStyle	Gets or sets the style of the **System.Windows.Shapes.Rectangle** used to show the focus on the C1DataGrid.
	FontFamily	(Inherited from System.Windows.Controls.Control)
	FontSize	(Inherited from System.Windows.Controls.Control)
	FontStretch	(Inherited from System.Windows.Controls.Control)
	FontStyle	(Inherited from System.Windows.Controls.Control)
	FontWeight	(Inherited from System.Windows.Controls.Control)
	Foreground	(Inherited from System.Windows.Controls.Control)
	FrozenBottomRowsCount	Gets or sets the number of rows that remain docked to the bottom of the viewport when the user scrolls vertically.
	FrozenColumnCount	Gets or sets the number of columns that remain docked to the left side of the viewport when the user scrolls horizontally.
	FrozenTopRowsCount	Gets or sets the number of rows that remain docked to the top of the viewport when the user scrolls vertically.
	GridLinesVisibility	Gets or sets a value that indicates whether the horizontal or vertical grid lines among cells are displayed or not.

	GroupColumnHeaderStyle	Gets or sets the style that is used when rendering the column headers in the group panel.
	GroupedColumns	Gets the collection of columns whose DataGridColumn.GroupState is different from null. This group of columns determine the grouping state of the C1DataGrid.
	GroupingPanelBackground	Gets or sets the **System.Windows.Media.Brush** that is used to paint the background of the grouping panel that is on top of the datagrid.
	GroupingPanelForeground	Gets or sets the **System.Windows.Media.Brush** that is used to paint the foreground of the grouping panel that is on top of the datagrid.
	GroupingPanelStyle	Gets or sets the **System.Windows.Style** that is set to the grouping panel that is on top of the datagrid.
	GroupRowHeaderStyle	Gets or sets the style of the header of the group row.
	GroupRowHeight	Gets or sets the row height for all rows of type group in the C1DataGrid.
	GroupRowPosition	Gets or sets where the group row will be located relatively to the items of the group.
	GroupRowStyle	Gets or sets the style of the grouping row.
	HeaderBackground	Gets or sets the **System.Windows.Media.Brush** used to paint the background of the headers of the datagrid besides grouping rows, freezing separator, scrollbars and filters.
	HeaderForeground	Gets or sets the **System.Windows.Media.Brush** used to highlight the foreground of the headers of the datagrid besides grouping rows, freezing separator, scrollbars and

		filters.
	HeadersVisibility	Gets or sets a value that indicates whether column or row headers are displayed or not.
	Height	(Inherited from System.Windows.FrameworkElement)
	HorizontalAlignment	(Inherited from System.Windows.FrameworkElement)
	HorizontalContentAlignment	(Inherited from System.Windows.Controls.Control)
	HorizontalGridLinesBrush	Gets or sets the **System.Windows.Media.Brush** used to display the horizontal grid lines.
	HorizontalScrollBarVisibility	Gets or sets a value that indicates how the horizontal scroll bar is displayed.
	IndentWidth	Gets or sets the width in pixels of each indentation level visible when the data is grouped.
	IsAddingNewRowsAllowed	Gets a value indicating whether it is possible to add new rows according to the inner **System.ComponentModel.ICollectionView** and C1DataGrid configuration.
	IsDetailsTogglingAllowed	Gets a value indicating whether it is possible to toggle row details according to the C1DataGrid configuration.
	IsEditingRowsAllowed	Gets a value indicating whether it is possible to edit rows according to the inner **System.ComponentModel.ICollectionView** and C1DataGrid configuration.
	IsEnabled	(Inherited from System.Windows.Controls.Control)
	IsFilteringRowsAllowed	Gets a value indicating whether it is possible to filter rows according to the inner **System.ComponentModel.ICollectionView** and

		C1DataGrid configuration.
	IsGroupingRowsAllowed	Gets a value indicating whether it is possible to group rows according to the inner **System.ComponentModel.ICollectionView** and C1DataGrid configuration.
	IsHitTestVisible	(Inherited from System.Windows.UIElement)
	IsLoading	Gets or sets a value indicating whether a visual indicator that cover all the data grid template is shown, demonstrating that the data is being loaded.
	IsMouseOver	Returns true if the mouse is over the control.
	IsReadOnly	Gets or sets a value indicating whether the user is able to add remove or modify info from the C1DataGrid.
	IsRemovingRowsAllowed	Gets a value indicating whether it is possible to remove rows according to the inner **System.ComponentModel.ICollectionView** and C1DataGrid configuration.
	IsSortingRowsAllowed	Gets a value indicating whether it is possible to sort rows according to the inner **System.ComponentModel.ICollectionView** and C1DataGrid configuration.
	IsTabStop	(Inherited from System.Windows.Controls.Control)
	Item	Overloaded. Gets the DataGridCell with the specified row and column index.
	ItemsSource	Gets or sets a collection that is used to generate the content of the control.
	Language	(Inherited from System.Windows.FrameworkElement)

	LeadingColumnWidth	Gets or sets the column width for the leading column (that is the empty space between the row headers and the first column, only visible when the data grid is grouped).
	LoadingIndicatorStyle	Gets or sets the Style used for the Loading indicator.
	Margin	(Inherited from System.Windows.FrameworkElement)
	MaxColumnWidth	Gets or sets the maximum column width for all the columns in the C1DataGrid.
	MaxHeight	(Inherited from System.Windows.FrameworkElement)
	MaxRowHeight	Gets or sets the maximum row height for all the rows in the C1DataGrid.
	MaxWidth	(Inherited from System.Windows.FrameworkElement)
	MinColumnWidth	Gets or sets the minimum column width for all the columns in the C1DataGrid.
	MinHeight	(Inherited from System.Windows.FrameworkElement)
	MinRowHeight	Gets or sets the minimum row height for all the rows in the C1DataGrid.
	MinWidth	(Inherited from System.Windows.FrameworkElement)
	MouseOverBrush	Gets or sets the **System.Windows.Media.Brush** used to highlight the control when it has the mouse over.
	Name	(Inherited from System.Windows.FrameworkElement)
	NewRowHeaderStyle	Gets or sets the style that is used when rendering the row header for entering new items.
	NewRowStyle	Gets or sets the style that is used when rendering the row for entering new items.

	NewRowVisibility	Gets or sets a value that indicates where the new row will be located. If Top is set the new row will be located on top of the data rows, if Bottom is set will be located at the bottom of the data rows.
	Opacity	(Inherited from System.Windows.UIElement)
	OpacityMask	(Inherited from System.Windows.UIElement)
	Padding	(Inherited from System.Windows.Controls.Control)
	Parent	(Inherited from System.Windows.FrameworkElement)
	PressedBrush	Gets or sets the **System.Windows.Media.Brush** used to paint a button when it is pressed.
	Projection	(Inherited from System.Windows.UIElement)
	RenderSize	(Inherited from System.Windows.UIElement)
	RenderTransform	(Inherited from System.Windows.UIElement)
	RenderTransformOrigin	(Inherited from System.Windows.UIElement)
	Resources	(Inherited from System.Windows.FrameworkElement)
	RowBackground	Gets or sets the **System.Windows.Media.Brush** that is used to paint row backgrounds.
	RowDetailsTemplate	Gets or sets the **System.Windows.DataTemplate** used to present the details part of a row.
	RowDetailsVisibilityMode	The details part can be automatically opened when the row is selected, can be always visible, or can be always collapsed.
	RowForeground	Gets or sets the **System.Windows.Media.Brush** that is used to paint row foregrounds.

	RowHeaderStyle	Gets or sets the style that is used when rendering the row headers.
	RowHeaderWidth	Gets or sets the width in pixels of all the row headers.
	RowHeight	Gets or sets the row height for all the data rows in the C1DataGrid.
	Rows	Gets the collection containing all the rows in the grid.
	RowStyle	Gets or sets the style that is used when rendering rows.
	ScrollBarStyle	Gets or sets the style that will be applied to the scrollbars of the data grid.
	ScrollMode	Gets or sets the scroll behavior of the C1DataGrid.
	ScrollPreviewRowTemplate	Gets or sets the **System.Windows.DataTemplate** used as preview of the scrolling row, when using DataGridScrollMode.Deferred as ScrollMode.
	SelectedBackground	Gets or sets the **System.Windows.Media.Brush** used to highlight the control when it is selected.
	SelectedIndex	Gets or sets the index of the selected row.
	SelectedItem	Gets or sets the data item corresponding to the selected row.
	SelectedItems	Gets the collection of selected items.
	Selection	Gets the selection object which allows to query the current selection as well as modifying it.
	SelectionMode	Gets or sets the selection mode of the grid. See DataGridSelectionMode enumeration to get a description of each mode.

	ShowFluidMouseOver	When set to true, hides the mouse over of the rows provides a fluid mouse effect over the body of the C1DataGrid. Uses the FluidMouseOverBrush and the RowHeight.
	ShowGroupingPanel	Gets or sets a value indicating whether the panel above the cells area used to group by a column is displayed.
	ShowValidationIndicators	Gets or sets a value indicating whether the validation icon will appear inside the corresponding row header as well as the background of the row with errors is turned to red.
	ShowVerticalFreezingSeparator	Gets or sets a value indicating which of the freezing separators (currently only Left separator is supported) is visible.
	SortedColumns	Gets the collection of columns whose DataGridColumn.SortState is different from null. This group of columns determine the sorting state of the C1DataGrid.
	Style	(Inherited from System.Windows.FrameworkElement)
	TabIndex	(Inherited from System.Windows.Controls.Control)
	TabNavigation	(Inherited from System.Windows.Controls.Control)
	Tag	(Inherited from System.Windows.FrameworkElement)
	Template	(Inherited from System.Windows.Controls.Control)
	TopRows	Gets the collection of rows that are placed on top of the item rows.
	Triggers	(Inherited from System.Windows.FrameworkElement)
	UseLayoutRounding	(Inherited from System.Windows.UIElement)

	ValidationBackground	Gets or sets the brush used to paint the background of the validation elements.
	ValidationForeground	Gets or sets the brush used to paint the foreground of the validation elements.
	VerticalAlignment	(Inherited from System.Windows.FrameworkElement)
	VerticalContentAlignment	(Inherited from System.Windows.Controls.Control)
	VerticalFreezingSeparatorStyle	Gets or sets the style of the separator between fixed and scrollable columns.
	VerticalFreezingSeparatorWidth	Gets or sets the width in pixels of the vertical freezing separator.
	VerticalGridLinesBrush	Gets or sets the **System.Windows.Media.Brush** used to display the vertical grid lines.
	VerticalScrollBarVisibility	Gets or sets a value that indicates how the vertical scroll bar is displayed.
	VerticalScrollStep	Gets a value indicating how the vertical scroll behaves when user press the up/down buttons of the vertical scroll bar or when the user uses the mouse wheel. This property is useful when the detail of the rows is too big, typically used in hierarchical scenarios.
	Viewport	Gets useful information about the scrolling state as well as current top/left or bottom/right shown cells.
	Visibility	(Inherited from System.Windows.UIElement)
	Width	(Inherited from System.Windows.FrameworkElement)

AlternatingRowBackground Property

Gets or sets the **System.Windows.Media.Brush** that is used to paint the background of odd-numbered rows.

Syntax

Visual Basic (Declaration)

```
Public Property AlternatingRowBackground As System.Windows.Media.Brush
```

C#

```
public System.Windows.Media.Brush AlternatingRowBackground {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

AlternatingRowForeground Property

Gets or sets the **System.Windows.Media.Brush** that is used to paint the foreground of odd-numbered rows.

Syntax

Visual Basic (Declaration)

```
Public Property AlternatingRowForeground As System.Windows.Media.Brush
```

C#

```
public System.Windows.Media.Brush AlternatingRowForeground {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

AutoGenerateColumns Property

Gets or sets a value indicating whether columns are created automatically when the ItemsSource property is set.

Syntax

Visual Basic (Declaration)

```
Public Property AutoGenerateColumns As System.Boolean
```

C#

```
public System.bool AutoGenerateColumns {get; set;}
```

Remarks

The event AutoGeneratingColumn will be raised for each column allowing to change or replace the generated column. After all columns are created the event AutoGeneratedColumns will be raised.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

BodyRect Property

Gets the rectangle that represent the area where the rows of the C1DataGrid are rendered. Useful to show adorners on top of the body.

Syntax

Visual Basic (Declaration)

```
Public Property BodyRect As System.Windows.Rect
```

C#

```
public System.Windows.Rect BodyRect {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

BottomRows Property

Gets the collection of rows that are placed at the bottom of the item rows.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property BottomRows As
System.Collections.ObjectModel.Collection(Of DataGridRow)
```

C#

```
public System.Collections.ObjectModel.Collection<DataGridRow> BottomRows
{get;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CanUserAddRows Property

Gets or sets a value indicating whether the user is able to enter new rows by entering the data in each cell of the "new row" typically located at the bottom of the data grid.

Syntax

Visual Basic (Declaration)

```
Public Property CanUserAddRows As System.Boolean
```

C#

```
public System.bool CanUserAddRows {get; set;}
```

Remarks

If set to false the "new row" element will not appear, therefore the user will not be able to enter new rows.

Notice the availability of this feature is conditioned to the fact that the ItemsSource set supports adding new items.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CanUserEditRows Property

Gets or sets a value indicating whether the user is able to edit the data of the cells.

Syntax

Visual Basic (Declaration)

```
Public Property CanUserEditRows As System.Boolean
```

C#

```
public System.bool CanUserEditRows {get; set;}
```

Remarks

If you want to prevent users from removing rows as well you can use IsReadOnly instead.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CanUserFilter Property

Gets or sets a value indicating whether the user is able to filter a column by opening the corresponding filter popup in the column header.

Syntax

Visual Basic (Declaration)

```
Public Property CanUserFilter As System.Boolean
```

C#

```
public System.bool CanUserFilter {get; set;}
```

Remarks

If set to false, no filter will be shown, otherwise will depend on the specific column filter availability.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CanUserFreezeColumns Property

Gets or sets a value indicating which of the freezing separators (currently only Left separator is supported) the user is able to drag in order to change the amount of frozen columns or rows.

Syntax

Visual Basic (Declaration)

```
Public Property CanUserFreezeColumns As DataGridColumnFreezing
```

C#

```
public DataGridColumnFreezing CanUserFreezeColumns {get; set;}
```

Remarks

Notice ShowVerticalFreezingSeparator must be set to true so that the separator is visible.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CanUserGroup Property

Gets or sets a value indicating whether the user is able to change groups by dragging column headers over the grouping area, removing groups pressing the remove button of each grouped column element inside the grouping area, or change the order of the groups clicking the grouped column element itself.

Syntax

Visual Basic (Declaration)

```
Public Property CanUserGroup As System.Boolean
```

C#

```
public System.bool CanUserGroup {get; set;}
```

Remarks

If you want to show the grouping panel but you want to prevent the user from changing the groups, set ShowGroupingPanel to true and set this property to false.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CanUserRemoveRows Property
Gets or sets a value indicating whether the user is able to remove rows by pressing Del key.

Syntax

Visual Basic (Declaration)

```
Public Property CanUserRemoveRows As System.Boolean
```

C#

```
public System.bool CanUserRemoveRows {get; set;}
```

Remarks

If you want to prevent users from adding and editing rows as well you can use IsReadOnly instead.

Notice the availability of this feature is conditioned to the fact that the ItemsSource set supports removing items.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CanUserReorderColumns Property

Gets or sets a value indicating whether the user is able to reorder columns by dragging the corresponding column header.

Syntax

Visual Basic (Declaration)
`Public Property CanUserReorderColumns As System.Boolean`
C#
`public System.bool CanUserReorderColumns {get; set;}`

Remarks

When the column header is being dragged an indicator will appear to determine the position where the column will be moved to. Dragging a column close to the viewport border will cause the data grid to auto-scroll.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CanUserResizeColumns Property

Gets or sets a value indicating whether the user is able to resize a column by dragging the right border of the column header.

Syntax

Visual Basic (Declaration)

```
Public Property CanUserResizeColumns As System.Boolean
```

C#

```
public System.bool CanUserResizeColumns {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CanUserResizeRows Property

Gets or sets a value indicating whether the user is able to resize a row by dragging the bottom border of the row header.

Syntax

Visual Basic (Declaration)

```
Public Property CanUserResizeRows As System.Boolean
```

C#

```
public System.bool CanUserResizeRows {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CanUserSelectByDragging Property

Gets or sets a value indicating whether dragging over cells panel will select them.

Syntax

Visual Basic (Declaration)

```
Public Property CanUserSelectByDragging As System.Boolean
```

C#

```
public System.bool CanUserSelectByDragging {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

CanUserSort Property

Gets or sets a value indicating whether the user is able to sort the data by clicking the column header.

Syntax

Visual Basic (Declaration)

```
Public Property CanUserSort As System.Boolean
```

C#

```
public System.bool CanUserSort {get; set;}
```

Remarks

If set to false, the user will not be able to sort the data, otherwise it will depend on the clicked column settings.

The first time the user click the column header the data will be sorted in ascending order, and the second time in descending order. if the Ctrl key is pressed while the user clicks the column header the sorting state of the others column will be preserved, otherwise the current column sort criteria will override the previous sorting state.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

CanUserToggleDetails Property
Gets or sets a value indicating whether the user is able to change the visibility of the row details by clicking a toggle button located in the top right corner of the corresponding row header.

Syntax

Visual Basic (Declaration)

```
Public Property CanUserToggleDetails As System.Boolean
```

C#

```
public System.bool CanUserToggleDetails {get; set;}
```

Remarks

Notice RowDetailsTemplate must be set in order to display the toggle button.

Optionally the property RowDetailsVisibilityMode can be set if the requirements fits one of the built-in modes.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

CellStyle Property

Gets or sets the style that is used when rendering the cells.

Syntax

Visual Basic (Declaration)

```
Public Property CellStyle As System.Windows.Style
```

C#

```
public System.Windows.Style CellStyle {get; set;}
```

Remarks

System.Windows.Style.TargetType of the **System.Windows.Style** must be set to DataGridCellPresenter.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ClipboardCopyMode Property

Gets or sets a value indicating the format of the text that will be copied to the clipboard.

Syntax

Visual Basic (Declaration)

```
Public Property ClipboardCopyMode As DataGridClipboardMode
```

C#

```
public DataGridClipboardMode ClipboardCopyMode {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ClipboardPasteMode Property

Gets or sets a value indicating the expected format of the text that will be copied from the clipboard.

Syntax

Visual Basic (Declaration)

```
Public Property ClipboardPasteMode As DataGridClipboardMode
```

C#

```
public DataGridClipboardMode ClipboardPasteMode {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ColumnHeaderClickAction Property

Gets or sets which action will be taken when user click a column header. By default the click action will execute a sorting operation, but this behavior can be changed to allow a user to select a whole column by pressing the corresponding column header. Typically used in Excel like scenarios.

Syntax

Visual Basic (Declaration)

```
Public Property ColumnHeaderClickAction As DataGridColumnHeaderClickAction
```

C#

```
public DataGridColumnHeaderClickAction ColumnHeaderClickAction {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

ColumnHeaderHeight Property
Gets or sets the height in pixels of all the column headers.

Syntax

Visual Basic (Declaration)

```
Public Property ColumnHeaderHeight As System.Double
```

C#

```
public System.double ColumnHeaderHeight {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

ColumnHeaderOptionsVisibility Property

Gets or sets a value indicating when the options drop-down of the columns headers will be visible.

Syntax

Visual Basic (Declaration)

```
Public Property ColumnHeaderOptionsVisibility As DataGridOptionsVisibility
```

C#

```
public DataGridOptionsVisibility ColumnHeaderOptionsVisibility {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

ColumnHeaderStyle Property

Gets or sets the style that is used when rendering the column headers.

Syntax

Visual Basic (Declaration)

```
Public Property ColumnHeaderStyle As System.Windows.Style
```

C#

```
public System.Windows.Style ColumnHeaderStyle {get; set;}
```

Remarks

System.Windows.Style.TargetType of the **System.Windows.Style** must be set to DataGridColumnHeaderPresenter.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Columns Property

Gets the collection of columns currently present in the grid.

Syntax

Visual Basic (Declaration)	
`Public ReadOnly Property Columns As DataGridColumnCollection`	
C#	
`public DataGridColumnCollection Columns {get;}`	

Property Value

The columns.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

ColumnWidth Property

Gets or sets the column width for all the columns in the C1DataGrid.

Syntax

Visual Basic (Declaration)

```
Public Property ColumnWidth As DataGridLength
```

C#

```
public DataGridLength ColumnWidth {get; set;}
```

Remarks

DataGridLength supports four different modes

Type	Description
Pixel	The width of the column will be the same as the amount of pixels specified.
Auto	The width of the column will be determined by the content of the cells in the columns.
Star	The viewport space will be divided among the Star and AutoStar columns.
AutoStar	Each column is assured to have enough space to show its content and when extra space is available it is divided among the Star and AutoStar columns.

If a column has the property Width set, the layout will take the value set in the column over the one in the data grid.

Notice MinColumnWidth and MaxColumnWidth has precedence over this property, that mean that if you set ColumnWidth=100 and MinColumnWidth=110 the actual value will be 110.

If you want to know the actual width in pixels of an auto-width column you should query DataGridColumn.ActualWidth.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CurrentCell Property

Gets or sets the cell that contains the focus inside the C1DataGrid. This cell can be changed by the user when navigating with the keyboard or mouse interaction.

Syntax

Visual Basic (Declaration)

```
Public Property CurrentCell As DataGridCell
```

C#

```
public DataGridCell CurrentCell {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CurrentColumn Property

Gets or sets the column that contains the focused cell. This cell is changed automatically as the user navigate among cells with the keyboard or because the mouse interaction.

Syntax

Visual Basic (Declaration)

```
Public Property CurrentColumn As DataGridColumn
```

C#

```
public DataGridColumn CurrentColumn {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CurrentRow Property

Gets or sets the row that contains the focused cell. This cell is changed automatically as the user navigate among cells with the keyboard or because the mouse interaction.

Syntax

Visual Basic (Declaration)

```
Public Property CurrentRow As DataGridRow
```

C#

```
public DataGridRow CurrentRow {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

DataSourceView Property

Gets the data source view currently used by the C1DataGrid.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property DataSourceView As
System.ComponentModel.ICollectionView
```

C#

```
public System.ComponentModel.ICollectionView DataSourceView {get;}
```

Property Value

The data source view.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

DragOverColumnStyle Property

Gets or sets the style applied to a **System.Windows.Controls.ContentControl** element used to show the dragged column while it moves.

Syntax

Visual Basic (Declaration)

```
Public Property DragOverColumnStyle As System.Windows.Style
```

C#

```
public System.Windows.Style DragOverColumnStyle {get; set;}
```

Remarks

System.Windows.Style.TargetType of the **System.Windows.Style** must be set to **System.Windows.Controls.ContentControl**.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

DragSourceColumnStyle Property

Gets or sets the style applied to a **System.Windows.Controls.ContentControl** that is placed over the source column when it starts the Drag and Drop operation.

Syntax

Visual Basic (Declaration)

```
Public Property DragSourceColumnStyle As System.Windows.Style
```

C#

```
public System.Windows.Style DragSourceColumnStyle {get; set;}
```

Remarks

System.Windows.Style.TargetType of the **System.Windows.Style** must be set to **System.Windows.Controls.ContentControl**.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

DropIndicatorStyle Property

Gets or sets the style applied to a **System.Windows.Controls.ContentControl** element used to indicate the position where the dragged column will be dropped.

Syntax

Visual Basic (Declaration)

```
Public Property DropIndicatorStyle As System.Windows.Style
```

C#

```
public System.Windows.Style DropIndicatorStyle {get; set;}
```

Remarks

System.Windows.Style.TargetType of the **System.Windows.Style** must be set to **System.Windows.Controls.ContentControl**.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

FilteredColumns Property

Gets the collection of columns whose DataGridColumn.FilterState is different from null. This group of columns determine the filtering state of the C1DataGrid.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property FilteredColumns As DataGridColumn()
```

C#

```
public DataGridColumn[] FilteredColumns {get;}
```

Remarks

Use FiltersCombination property in order to change the logical way the filter predicates are joined.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

C1DataGrid Class

FiltersCombination Property

Gets or sets the logical way the filters are combined among the columns.

Syntax

Visual Basic (Declaration)

```
Public Property FiltersCombination As DataGridFilterCombination
```

C#

```
public DataGridFilterCombination FiltersCombination {get; set;}
```

Remarks

By default when the user filters the data by setting the filter in more than one column, the logical operator applied among filters is "And", that means that the data displayed must obey the criteria set in both filters. This can be changed to "Or" in order to allow showing data that obey at least one filter criteria.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

FilterStyle Property

Gets or sets the Style used for the Filter control container.

Syntax

Visual Basic (Declaration)

```
Public Property FilterStyle As System.Windows.Style
```

C#

```
public System.Windows.Style FilterStyle {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Focused Property

Gets or sets a value indicating whether this C1DataGrid is focused.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property Focused As System.Boolean
```

C#

```
public System.bool Focused {get;}
```

Property Value

`true` if the grid is focused; otherwise, `false`.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

FocusStyle Property

Gets or sets the style of the **System.Windows.Shapes.Rectangle** used to show the focus on the C1DataGrid.

Syntax

Visual Basic (Declaration)

```
Public Property FocusStyle As System.Windows.Style
```

C#

```
public System.Windows.Style FocusStyle {get; set;}
```

Remarks

System.Windows.Style.TargetType of the **System.Windows.Style** must be set to **System.Windows.Shapes.Rectangle**.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

FrozenBottomRowsCount Property

Gets or sets the number of rows that remain docked to the bottom of the viewport when the user scrolls vertically.

Syntax

Visual Basic (Declaration)

```
Public Property FrozenBottomRowsCount As System.Integer
```

C#

```
public System.int FrozenBottomRowsCount {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

FrozenColumnCount Property
Gets or sets the number of columns that remain docked to the left side of the viewport when the user scrolls horizontally.

Syntax

Visual Basic (Declaration)

```
Public Property FrozenColumnCount As System.Integer
```

C#

```
public System.int FrozenColumnCount {get; set;}
```

Remarks

The user can change the number of frozen column by dragging the vertical freezing separator, to make this the properties CanUserFreezeColumns and ShowVerticalFreezingSeparator must be set to Left.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

FrozenTopRowsCount Property
Gets or sets the number of rows that remain docked to the top of the viewport when the user scrolls vertically.

Syntax

Visual Basic (Declaration)

```
Public Property FrozenTopRowsCount As System.Integer
```

C#

```
public System.int FrozenTopRowsCount {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

GridLinesVisibility Property

Gets or sets a value that indicates whether the horizontal or vertical grid lines among cells are displayed or not.

Syntax

Visual Basic (Declaration)

```
Public Property GridLinesVisibility As DataGridGridLinesVisibility
```

C#

```
public DataGridGridLinesVisibility GridLinesVisibility {get; set;}
```

Remarks

Default value is Vertical

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

GroupColumnHeaderStyle Property

Gets or sets the style that is used when rendering the column headers in the group panel.

Syntax

Visual Basic (Declaration)
`Public Property GroupColumnHeaderStyle As System.Windows.Style`
C#
`public System.Windows.Style GroupColumnHeaderStyle {get; set;}`

Remarks

System.Windows.Style.TargetType of the **System.Windows.Style** must be set to DataGridGroupColumnHeaderPresenter.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GroupedColumns Property

Gets the collection of columns whose DataGridColumn.GroupState is different from null. This group of columns determine the grouping state of the C1DataGrid.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property GroupedColumns As DataGridColumn()
```

C#

```
public DataGridColumn[] GroupedColumns {get;}
```

Remarks

The order of the columns in the array is the order the groups are created.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GroupingPanelBackground Property

Gets or sets the **System.Windows.Media.Brush** that is used to paint the background of the grouping panel that is on top of the datagrid.

Syntax

Visual Basic (Declaration)

```
Public Property GroupingPanelBackground As System.Windows.Media.Brush
```

C#

```
public System.Windows.Media.Brush GroupingPanelBackground {get; set;}
```

Remarks

ShowGroupingPanel or CanUserGroup must be true in order that the grouping panel is visible.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

GroupRowHeight Property

Gets or sets the row height for all rows of type group in the C1DataGrid.

Syntax

Visual Basic (Declaration)

```
Public Property GroupRowHeight As DataGridLength
```

C#

```
public DataGridLength GroupRowHeight {get; set;}
```

Remarks

See RowHeight for more details.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

HeaderForeground Property

Gets or sets the **System.Windows.Media.Brush** used to highlight the foreground of the headers of the datagrid besides grouping rows, freezing separator, scrollbars and filters.

Syntax

Visual Basic (Declaration)

```
Public Property HeaderForeground As System.Windows.Media.Brush
```

C#

```
public System.Windows.Media.Brush HeaderForeground {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

HeadersVisibility Property

Gets or sets a value that indicates whether column or row headers are displayed or not.

Syntax

Visual Basic (Declaration)

```
Public Property HeadersVisibility As DataGridHeadersVisibility
```

C#

```
public DataGridHeadersVisibility HeadersVisibility {get; set;}
```

Remarks

Default value is All, Both column and row headers will be shown.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

HorizontalGridLinesBrush Property

Gets or sets the **System.Windows.Media.Brush** used to display the horizontal grid lines.

Syntax

Visual Basic (Declaration)

```
Public Property HorizontalGridLinesBrush As System.Windows.Media.Brush
```

C#

```
public System.Windows.Media.Brush HorizontalGridLinesBrush {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

HorizontalScrollBarVisibility Property

Gets or sets a value that indicates how the horizontal scroll bar is displayed.

Syntax

Visual Basic (Declaration)

```
Public Property HorizontalScrollBarVisibility As
System.Windows.Controls.ScrollBarVisibility
```

C#

```
public System.Windows.Controls.ScrollBarVisibility
HorizontalScrollBarVisibility {get; set;}
```

Remarks

Default value is Auto.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

IndentWidth Property

Gets or sets the width in pixels of each indentation level visible when the data is grouped.

Syntax

Visual Basic (Declaration)

```
Public Property IndentWidth As System.Double
```

C#

```
public System.double IndentWidth {get; set;}
```

Remarks

The width of the leading column (that is the empty space between the row headers and the first column, only visible when the data grid is grouped) is determined by default as (IndentWidth * number of grouping levels). If you want to change that value you can set LeadingColumnWidth.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IsReadOnly Property

Gets or sets a value indicating whether the user is able to add remove or modify info from the C1DataGrid.

Syntax

Visual Basic (Declaration)
`Public Property IsReadOnly As System.Boolean`
C#
`public System.bool IsReadOnly {get; set;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IsRemovingRowsAllowed Property

Gets a value indicating whether it is possible to remove rows according to the inner **System.ComponentModel.ICollectionView** and C1DataGrid configuration.

Syntax

Visual Basic (Declaration)
`Public ReadOnly Property IsRemovingRowsAllowed As System.Boolean`
C#
`public System.bool IsRemovingRowsAllowed {get;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IsSortingRowsAllowed Property

Gets a value indicating whether it is possible to sort rows according to the inner **System.ComponentModel.ICollectionView** and C1DataGrid configuration.

Syntax

Visual Basic (Declaration)
`Public ReadOnly Property IsSortingRowsAllowed As System.Boolean`
C#
`public System.bool IsSortingRowsAllowed {get;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Item Property
Gets the DataGridCell with the specified row and column index.

Overload List

Overload	Description
Item(Int32,Int32)	Gets the DataGridCell with the specified row and column index.
Item(DataGridRow,DataGridColumn)	Gets the DataGridCell with the specified row and column.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

Item(Int32,Int32) Property
Gets the DataGridCell with the specified row and column index.

Syntax

Visual Basic (Declaration)

```
Public Overloads ReadOnly Property Item( _
   ByVal rowIndex As System.Integer, _
```

```
   ByVal columnIndex As System.Integer _
) As DataGridCell
```

C#

```
public DataGridCell Item(
   System.int rowIndex,
   System.int columnIndex
) {get;}
```

Parameters

rowIndex

columnIndex

Property Value

The cell in the specified row and column

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Overload List

Item(DataGridRow,DataGridColumn) Property
Gets the DataGridCell with the specified row and column.

Syntax

Visual Basic (Declaration)

```
Public Overloads ReadOnly Property Item( _
   ByVal row As DataGridRow, _
   ByVal column As DataGridColumn _
) As DataGridCell
```

C#

```
public DataGridCell Item(
   DataGridRow row,
   DataGridColumn column
) {get;}
```

Parameters

row

column

Property Value

The cell in the specified row and column

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

ItemsSource Property

Gets or sets a collection that is used to generate the content of the control.

Syntax

Visual Basic (Declaration)
`Public Property ItemsSource As System.Collections.IEnumerable`
C#
`public System.Collections.IEnumerable ItemsSource {get; set;}`

Remarks

If the collection passed in is a **System.ComponentModel.ICollectionView**, the group, filter, and sort operations will be delegated to it.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

LeadingColumnWidth Property

Gets or sets the column width for the leading column (that is the empty space between the row headers and the first column, only visible when the data grid is grouped).

Syntax

Visual Basic (Declaration)

```
Public Property LeadingColumnWidth As DataGridLength
```

C#

```
public DataGridLength LeadingColumnWidth {get; set;}
```

Remarks

If the value is set to Auto, the width of the leading column will be calculated as (IndentWidth * number of group levels).

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

LoadingIndicatorStyle Property

Gets or sets the Style used for the Loading indicator.

Syntax

Visual Basic (Declaration)

```
Public Property LoadingIndicatorStyle As System.Windows.Style
```

C#

```
public System.Windows.Style LoadingIndicatorStyle {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

MaxColumnWidth Property

Gets or sets the maximum column width for all the columns in the C1DataGrid.

Syntax

Visual Basic (Declaration)

```
Public Property MaxColumnWidth As System.Double
```

C#

```
public System.double MaxColumnWidth {get; set;}
```

Remarks

If a column has the property MaxWidth set, the layout will take the value set in the column over the one in the data grid.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

MaxRowHeight Property

Gets or sets the maximum row height for all the rows in the C1DataGrid.

Syntax

Visual Basic (Declaration)

```
Public Property MaxRowHeight As System.Double
```

C#

```
public System.double MaxRowHeight {get; set;}
```

Remarks

If a row has the property MaxHeight set, the layout will take the value set in the row over the one in the data grid.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

MinColumnWidth Property

Gets or sets the minimum column width for all the columns in the C1DataGrid.

Syntax

Visual Basic (Declaration)

```
Public Property MinColumnWidth As System.Double
```

C#

```
public System.double MinColumnWidth {get; set;}
```

Remarks

If a column has the property MinWidth set, the layout will take the value set in the column over the one in the data grid.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

MinRowHeight Property

Gets or sets the minimum row height for all the rows in the C1DataGrid.

Syntax

Visual Basic (Declaration)

```
Public Property MinRowHeight As System.Double
```

C#

```
public System.double MinRowHeight {get; set;}
```

Remarks

If a row has the property MinHeight set, the layout will take the value set in the row over the one in the data grid.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

MouseOverBrush Property

Gets or sets the **System.Windows.Media.Brush** used to highlight the control when it has the mouse over.

Syntax

Visual Basic (Declaration)

```
Public Property MouseOverBrush As System.Windows.Media.Brush
```

C#

```
public System.Windows.Media.Brush MouseOverBrush {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

NewRowHeaderStyle Property

Gets or sets the style that is used when rendering the row header for entering new items.

Syntax

Visual Basic (Declaration)

```
Public Property NewRowHeaderStyle As System.Windows.Style
```

C#

```
public System.Windows.Style NewRowHeaderStyle {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

NewRowStyle Property

Gets or sets the style that is used when rendering the row for entering new items.

Syntax

Visual Basic (Declaration)
`Public Property NewRowStyle As System.Windows.Style`
C#
`public System.Windows.Style NewRowStyle {get; set;}`

Remarks

System.Windows.Style.TargetType of the **System.Windows.Style** must be set to DataGridNewRowPresenter.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

NewRowVisibility Property

Gets or sets a value that indicates where the new row will be located. If Top is set the new row will be located on top of the data rows, if Bottom is set will be located at the bottom of the data rows.

Syntax

Visual Basic (Declaration)

```
Public Property NewRowVisibility As DataGridNewRowVisibility
```

C#

```
public DataGridNewRowVisibility NewRowVisibility {get; set;}
```

Remarks

This property can be used along with FrozenTopRowsCount or FrozenBottomRowsCount to make the row always visible when the user scrolls the data.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

PressedBrush Property

Gets or sets the **System.Windows.Media.Brush** used to paint a button when it is pressed.

Syntax

Visual Basic (Declaration)

```
Public Property PressedBrush As System.Windows.Media.Brush
```

C#

```
public System.Windows.Media.Brush PressedBrush {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

RowBackground Property

Gets or sets the **System.Windows.Media.Brush** that is used to paint row backgrounds.

Syntax

Visual Basic (Declaration)

```
Public Property RowBackground As System.Windows.Media.Brush
```

C#

```
public System.Windows.Media.Brush RowBackground {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

RowDetailsTemplate Property

Gets or sets the **System.Windows.DataTemplate** used to present the details part of a row.

Syntax

Visual Basic (Declaration)

```
Public Property RowDetailsTemplate As System.Windows.DataTemplate
```

C#

```
public System.Windows.DataTemplate RowDetailsTemplate {get; set;}
```

Remarks

See RowDetailsVisibilityMode to set the way the details of each row are shown, or CanUserToggleDetails to set whether the toggle button in the row header is visible or not.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

RowDetailsVisibilityMode Property

The details part can be automatically opened when the row is selected, can be always visible, or can be always collapsed.

Syntax

Visual Basic (Declaration)

```
Public Property RowDetailsVisibilityMode As DataGridRowDetailsVisibilityMode
```

C#

```
public DataGridRowDetailsVisibilityMode RowDetailsVisibilityMode {get; set;}
```

Remarks

The details can be expanded by code using the property DetailsVisibility in the DataGridRow, or manually by pressing the toggle button located inside the row headers. Notice the CanUserToggleDetails must be set to true.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

RowForeground Property

Gets or sets the **System.Windows.Media.Brush** that is used to paint row foregrounds.

Syntax

Visual Basic (Declaration)
`Public Property RowForeground As System.Windows.Media.Brush`
C#
`public System.Windows.Media.Brush RowForeground {get; set;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

C1DataGrid Class
C1DataGrid Members

RowHeaderStyle Property

Gets or sets the style that is used when rendering the row headers.

Syntax

Visual Basic (Declaration)
`Public Property RowHeaderStyle As System.Windows.Style`
C#
`public System.Windows.Style RowHeaderStyle {get; set;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

C1DataGrid Class

RowHeaderWidth Property

Gets or sets the width in pixels of all the row headers.

Syntax

Visual Basic (Declaration)

```
Public Property RowHeaderWidth As System.Double
```

C#

```
public System.double RowHeaderWidth {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

C1DataGrid Class
C1DataGrid Members

RowHeight Property

Gets or sets the row height for all the data rows in the C1DataGrid.

Syntax

Visual Basic (Declaration)

```
Public Property RowHeight As DataGridLength
```

C#

```
public DataGridLength RowHeight {get; set;}
```

Remarks

Only Pixel and Auto modes are allowed. If the value to be set is of type pixel, the amount of pixels must be specified, If the value is of type Auto, the height of the row will be determined by the content of the cells of each row.

If a row has the property Height set, the layout will take the value set in the row over the one in the data grid.

Notice MinRowHeight and MaxRowHeight has precedence over this property, that mean that if you set RowHeight=100 and MinRowHeight=110 the actual value will be 110.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Rows Property
Gets the collection containing all the rows in the grid.

Syntax

Visual Basic (Declaration)
`Public ReadOnly Property Rows As DataGridRowCollection`
C#
`public DataGridRowCollection Rows {get;}`

Property Value

The rows in the grid.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

RowStyle Property

Gets or sets the style that is used when rendering rows.

Syntax

Visual Basic (Declaration)
`Public Property RowStyle As System.Windows.Style`
C#
`public System.Windows.Style RowStyle {get; set;}`

Remarks

System.Windows.Style.TargetType of the **System.Windows.Style** must be set to DataGridRowPresenter.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ScrollBarStyle Property

Gets or sets the style that will be applied to the scrollbars of the data grid.

Syntax

Visual Basic (Declaration)
`Public Property ScrollBarStyle As System.Windows.Style`
C#

```
public System.Windows.Style ScrollBarStyle {get; set;}
```

Remarks

System.Windows.Style.TargetType of the **System.Windows.Style** must be set to **System.Windows.Controls.Primitives.ScrollBar**.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

ScrollMode Property

Gets or sets the scroll behavior of the C1DataGrid.

Syntax

Visual Basic (Declaration)
`Public Property ScrollMode As DataGridScrollMode`
C#
`public DataGridScrollMode ScrollMode {get; set;}`

Remarks

Mode	Description
RealTime	The page is updated every time the ThumbTrack event of the **System.Windows.Controls.Primitives.ScrollBar** is fired.
Deferred	The page is updated once the EndScroll event of the **System.Windows.Controls.Primitives.ScrollBar** is fired.

Default value is RealTime.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

SelectedBackground Property

Gets or sets the **System.Windows.Media.Brush** used to highlight the control when it is selected.

Syntax

Visual Basic (Declaration)
`Public Property SelectedBackground As System.Windows.Media.Brush`

C#

```
public System.Windows.Media.Brush SelectedBackground {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

SelectedItem Property

Gets or sets the data item corresponding to the selected row.

Syntax

Visual Basic (Declaration)

```
Public Property SelectedItem As System.Object
```

C#

```
public System.object SelectedItem {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

C1DataGrid Members

Selection Property

Gets the selection object which allows to query the current selection as well as modifying it.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property Selection As DataGridSelection
```

C#

```
public DataGridSelection Selection {get;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

C1DataGrid Members

SelectionMode Property

Gets or sets the selection mode of the grid. See DataGridSelectionMode enumeration to get a description of each mode.

Syntax

Visual Basic (Declaration)

```
Public Property SelectionMode As DataGridSelectionMode
```

C#

```
public DataGridSelectionMode SelectionMode {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

ShowFluidMouseOver Property

When set to true, hides the mouse over of the rows provides a fluid mouse effect over the body of the C1DataGrid. Uses the FluidMouseOverBrush and the RowHeight.

Syntax

Visual Basic (Declaration)

```
Public Property ShowFluidMouseOver As System.Boolean
```

C#

```
public System.bool ShowFluidMouseOver {get; set;}
```

Remarks

Recommended use of this property is for not editable C1DataGrid with fixed RowHeight, in other cases the selection might be confusing for the end user.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

ShowGroupingPanel Property

Gets or sets a value indicating whether the panel above the cells area used to group by a column is displayed.

Syntax

Visual Basic (Declaration)

```
Public Property ShowGroupingPanel As System.Boolean
```

C#

```
public System.bool ShowGroupingPanel {get; set;}
```

Remarks

If you want to show the grouping panel but you want to prevent the user from changing the groups you should set the property CanUserGroup to false.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

C1DataGrid Class
C1DataGrid Members

ShowValidationIndicators Property

Gets or sets a value indicating whether the validation icon will appear inside the corresponding row header as well as the background of the row with errors is turned to red.

Syntax

Visual Basic (Declaration)

```
Public Property ShowValidationIndicators As System.Boolean
```

C#

```
public System.bool ShowValidationIndicators {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

ShowVerticalFreezingSeparator Property

Gets or sets a value indicating which of the freezing separators (currently only Left separator is supported) is visible.

Syntax

Visual Basic (Declaration)

```
Public Property ShowVerticalFreezingSeparator As DataGridColumnFreezing
```

C#

```
public DataGridColumnFreezing ShowVerticalFreezingSeparator {get; set;}
```

Remarks

If you want to prevent the user from changing the amount of frozen columns you should set the property CanUserFreezeColumns to None.

Additionally you can change the width of the separator by changing the property VerticalFreezingSeparatorWidth.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

SortedColumns Property

Gets the collection of columns whose DataGridColumn.SortState is different from null. This group of columns determine the sorting state of the C1DataGrid.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property SortedColumns As DataGridColumn()
```

C#

```
public DataGridColumn[] SortedColumns {get;}
```

Remarks

The order of the columns in the array is the order the data is sorted.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

TopRows Property

Gets the collection of rows that are placed on top of the item rows.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property TopRows As
System.Collections.ObjectModel.Collection(Of DataGridRow)
```

C#

```
public System.Collections.ObjectModel.Collection<DataGridRow> TopRows {get;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

C1DataGrid Members

VerticalFreezingSeparatorStyle Property

Gets or sets the style of the separator between fixed and scrollable columns.

Syntax

Visual Basic (Declaration)

```
Public Property VerticalFreezingSeparatorStyle As System.Windows.Style
```

C#

```
public System.Windows.Style VerticalFreezingSeparatorStyle {get; set;}
```

Remarks

System.Windows.Style.TargetType of the **System.Windows.Style** must be set to DataGridVerticalFreezingSeparatorPresenter.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

VerticalFreezingSeparatorWidth Property

Gets or sets the width in pixels of the vertical freezing separator.

Syntax

Visual Basic (Declaration)

```
Public Property VerticalFreezingSeparatorWidth As System.Double
```

C#

```
public System.double VerticalFreezingSeparatorWidth {get; set;}
```

Remarks

Default value is 5 pixels.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

VerticalGridLinesBrush Property

Gets or sets the **System.Windows.Media.Brush** used to display the vertical grid lines.

Syntax

Visual Basic (Declaration)
`Public Property VerticalGridLinesBrush As System.Windows.Media.Brush`
C#
`public System.Windows.Media.Brush VerticalGridLinesBrush {get; set;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

VerticalScrollBarVisibility Property

Gets or sets a value that indicates how the vertical scroll bar is displayed.

Syntax

Visual Basic (Declaration)
`Public Property VerticalScrollBarVisibility As System.Windows.Controls.ScrollBarVisibility`
C#
`public System.Windows.Controls.ScrollBarVisibility VerticalScrollBarVisibility {get; set;}`

Remarks

Default value is Auto.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

VerticalScrollStep Property

Gets a value indicating how the vertical scroll behaves when user press the up/down buttons of the vertical scroll bar or when the user uses the mouse wheel. This property is useful when the detail of the rows is too big, typically used in hierarchical scenarios.

Syntax

Visual Basic (Declaration)
`Public Property VerticalScrollStep As DataGridScrollStep`
C#
`public DataGridScrollStep VerticalScrollStep {get; set;}`

Remarks

Mode	Description
Discrete	Always a row will be scrolled independently the size of the row.
Pixel	Each time the mouse wheel event is raised an specified number of pixels is scrolled.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Viewport Property

Gets useful information about the scrolling state as well as current top/left or bottom/right shown cells.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property Viewport As DataGridViewport
```

C#

```
public DataGridViewport Viewport {get;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Public Fields

	Name	Description
S	AlternatingRowBackgroundProperty	Identifies the AlternatingRowBackground dependency property.
S	AlternatingRowForegroundProperty	Identifies the AlternatingRowForeground dependency property.
S	AutoGenerateColumnsProperty	Identifies the AutoGenerateColumns dependency property.
S	BodyRectProperty	Identifies the BodyRect dependency property.
S	CanUserAddRowsProperty	Identifies the CanUserAddRows dependency property.
S	CanUserEditRowsProperty	Identifies the CanUserEditRows dependency property.
S	CanUserFilterProperty	Identifies the CanUserFilter dependency property.
S	CanUserFreezeColumnsProperty	Identifies the CanUserFreezeColumns dependency property.
S	CanUserGroupProperty	Identifies the CanUserGroup dependency property.
S	CanUserRemoveRowsProperty	Identifies the CanUserRemoveRows dependency property.

S	CanUserReorderColumnsProperty	Identifies the CanUserReorderColumns dependency property.
S	CanUserResizeColumnsProperty	Identifies the CanUserResizeColumns dependency property.
S	CanUserResizeRowsProperty	Identifies the CanUserResizeRows dependency property.
S	CanUserSelectByDraggingProperty	Identifies the CanUserSelectByDragging dependency property.
S	CanUserSortProperty	Identifies the CanUserSort dependency property.
S	CanUserToggleDetailsProperty	Identifies the CanUserToggleDetails dependency property.
S	CellStyleProperty	Identifies the CellStyle dependency property.
S	ClipboardCopyModeProperty	Identifies the ClipboardCopyMode dependency property.
S	ClipboardPasteModeProperty	Identifies the ClipboardPasteMode dependency property.
S	ColumnHeaderClickActionProperty	Identifies the ColumnHeaderClickAction dependency property.
S	ColumnHeaderHeightProperty	Identifies the ColumnHeaderHeight dependency property.
S	ColumnHeaderOptionsVisibilityProperty	Identifies the ColumnHeaderOptionsVisibility dependency property.
S	ColumnHeaderStyleProperty	Identifies the ColumnHeaderStyle dependency property.

S	ColumnWidthProperty	Identifies the ColumnWidth dependency property.
S	CurrentColumnProperty	Identifies the CurrentColumn dependency property.
S	CurrentRowProperty	Identifies the CurrentRow dependency property.
S	DragOverColumnStyleProperty	Identifies the DragOverColumnStyle dependency property.
S	DragSourceColumnStyleProperty	Identifies the DragSourceColumnStyle dependency property.
S	DropIndicatorStyleProperty	Identifies the DropIndicatorStyle dependency property.
S	FiltersCombinationProperty	Identifies the FiltersCombination dependency property.
S	FilterStyleProperty	Identifies the FilterStyle dependency property.
S	FocusStyleProperty	Identifies the FocusStyle dependency property.
S	FrozenBottomRowsCountProperty	Identifies the FrozenBottomRowsCount dependency property.
S	FrozenColumnCountProperty	Identifies the FrozenColumnCount dependency property.
S	FrozenTopRowsCountProperty	Identifies the FrozenTopRowsCount dependency property.
S	GridLinesVisibilityProperty	Identifies the GridLinesVisibility dependency property.

S	GroupColumnHeaderStyleProperty	Identifies the GroupColumnHeaderStyle dependency property.
S	GroupingPanelBackgroundProperty	Identifies the GroupingPanelBackground dependency property.
S	GroupingPanelForegroundProperty	Identifies the GroupingPanelForeground dependency property.
S	GroupingPanelStyleProperty	Identifies the GroupingPanelStyle dependency property.
S	GroupRowHeaderStyleProperty	Identifies the GroupRowHeaderStyle dependency property.
S	GroupRowHeightProperty	Identifies the GroupRowHeight dependency property.
S	GroupRowPositionProperty	Identifies the GroupRowPosition dependency property.
S	GroupRowStyleProperty	Identifies the GroupRowStyle dependency property.
S	HeaderBackgroundProperty	Identifies the HeaderBackground dependency property.
S	HeaderForegroundProperty	Identifies the HeaderForeground dependency property.
S	HeadersVisibilityProperty	Identifies the HeadersVisibility dependency property.
S	HorizontalGridLinesBrushProperty	Identifies the HorizontalGridLinesBrush dependency property.
S	HorizontalScrollBarVisibilityProperty	Identifies the HorizontalScrollBarVisibility

		dependency property.
S	IndentWidthProperty	Identifies the IndentWidth dependency property.
S	IsLoadingProperty	Identifies the IsLoading dependency property.
S	IsMouseOverProperty	Identifies the IsMouseOver dependency property.
S	IsReadOnlyProperty	Identifies the IsReadOnly dependency property.
S	ItemsSourceProperty	Identifies the ItemsSource dependency property.
S	LeadingColumnWidthProperty	Identifies the LeadingColumnWidth dependency property.
S	LoadingIndicatorStyleProperty	Identifies the LoadingIndicatorStyle dependency property.
S	MaxColumnWidthProperty	Identifies the MaxColumnWidth dependency property.
S	MaxRowHeightProperty	Identifies the MaxRowHeight dependency property.
S	MinColumnWidthProperty	Identifies the MinColumnWidth dependency property.
S	MinRowHeightProperty	Identifies the MinRowHeight dependency property.
S	MouseOverBrushProperty	Identifies the MouseOverBrush dependency property.

S	NewRowHeaderStyleProperty	Identifies the NewRowHeaderStyle dependency property.
S	NewRowStyleProperty	Identifies the NewRowStyle dependency property.
S	NewRowVisibilityProperty	Identifies the NewRowVisibility dependency property.
S	PressedBrushProperty	Identifies the PressedBrush dependency property.
S	RowBackgroundProperty	Identifies the RowBackground dependency property.
S	RowDetailsTemplateProperty	Identifies the RowDetailsTemplate dependency property.
S	RowDetailsVisibilityModeProperty	Identifies the RowDetailsVisibilityMode dependency property.
S	RowForegroundProperty	Identifies the RowForeground dependency property.
S	RowHeaderStyleProperty	Identifies the RowHeaderStyle dependency property.
S	RowHeaderWidthProperty	Identifies the RowHeaderWidth dependency property.
S	RowHeightProperty	Identifies the RowHeight dependency property.
S	RowStyleProperty	Identifies the RowStyle dependency property.
S	ScrollBarStyleProperty	Identifies the ScrollBarStyle dependency property.

S	ScrollModeProperty	Identifies the ScrollMode dependency property.
S	ScrollPreviewRowTemplateProperty	Identifies the ScrollPreviewRowTemplate dependency property.
S	SelectedBackgroundProperty	Identifies the SelectedBackground dependency property.
S	SelectedIndexProperty	Identifies the SelectedIndex dependency property.
S	SelectedItemProperty	Identifies the SelectedItem dependency property.
S	SelectionModeProperty	Identifies the SelectionMode dependency property.
S	ShowFluidMouseOverProperty	Identifies the ShowFluidMouseOver dependency property.
S	ShowGroupingPanelProperty	Identifies the ShowGroupingPanel dependency property.
S	ShowValidationIndicatorsProperty	Identifies the ShowValidationIndicators dependency property.
S	ShowVerticalFreezingSeparatorProperty	Identifies the ShowVerticalFreezingSeparator dependency property.
S	ValidationBackgroundProperty	Identifies the ValidationBackground dependency property.
S	ValidationForegroundProperty	Identifies the ValidationForeground dependency property.
S	VerticalFreezingSeparatorStyleProperty	Identifies the VerticalFreezingSeparatorStyle

		dependency property.
S	VerticalFreezingSeparatorWidthProperty	Identifies the VerticalFreezingSeparatorWidth dependency property.
S	VerticalGridLinesBrushProperty	Identifies the VerticalGridLinesBrush dependency property.
S	VerticalScrollBarVisibilityProperty	Identifies the VerticalScrollBarVisibility dependency property.
S	VerticalScrollStepProperty	Identifies the VerticalScrollStep dependency property.

AlternatingRowBackgroundProperty Field

Identifies the AlternatingRowBackground dependency property.

Syntax

Visual Basic (Declaration)

```
Public Shared ReadOnly AlternatingRowBackgroundProperty As
System.Windows.DependencyProperty
```

C#

```
public static readonly System.Windows.DependencyProperty
AlternatingRowBackgroundProperty
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GroupColumnHeaderStyleProperty Field

Identifies the GroupColumnHeaderStyle dependency property.

Syntax

Visual Basic (Declaration)

```
Public Shared ReadOnly GroupColumnHeaderStyleProperty As
System.Windows.DependencyProperty
```

C#

```
public static readonly System.Windows.DependencyProperty
GroupColumnHeaderStyleProperty
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GroupingPanelBackgroundProperty Field

Identifies the GroupingPanelBackground dependency property.

Syntax

Visual Basic (Declaration)

```
Public Shared ReadOnly GroupingPanelBackgroundProperty As
System.Windows.DependencyProperty
```

C#

```
public static readonly System.Windows.DependencyProperty
GroupingPanelBackgroundProperty
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

C1DataGrid Members

VerticalFreezingSeparatorWidthProperty Field

Identifies the VerticalFreezingSeparatorWidth dependency property.

Syntax

Visual Basic (Declaration)
`Public Shared ReadOnly VerticalFreezingSeparatorWidthProperty As System.Windows.DependencyProperty`
C#
`public static readonly System.Windows.DependencyProperty VerticalFreezingSeparatorWidthProperty`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

VerticalGridLinesBrushProperty Field

Identifies the VerticalGridLinesBrush dependency property.

Syntax

Visual Basic (Declaration)
`Public Shared ReadOnly VerticalGridLinesBrushProperty As System.Windows.DependencyProperty`
C#
`public static readonly System.Windows.DependencyProperty VerticalGridLinesBrushProperty`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

VerticalScrollBarVisibilityProperty Field

Identifies the VerticalScrollBarVisibility dependency property.

Syntax

Visual Basic (Declaration)
`Public Shared ReadOnly VerticalScrollBarVisibilityProperty As System.Windows.DependencyProperty`
C#
`public static readonly System.Windows.DependencyProperty VerticalScrollBarVisibilityProperty`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

VerticalScrollStepProperty Field

Identifies the VerticalScrollStep dependency property.

Syntax

Visual Basic (Declaration)

```
Public Shared ReadOnly VerticalScrollStepProperty As
System.Windows.DependencyProperty
```

C#

```
public static readonly System.Windows.DependencyProperty
VerticalScrollStepProperty
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Events

%%scrap%%

" -->

For a list of all members of this type, see C1DataGrid members.

Public Events

	Name	Description
	AutoGeneratedColumns	Occurs after all the auto-generated columns are created.
	AutoGeneratingColumn	Occurs when the auto-generated columns are being created.
	BeganEdit	Occurs after a cell began to be edited.
	BeginningEdit	Occurs before a cell begins to be edited.
	BeginningNewRow	Occurs when a new row begins to be edited.

	BeginningRowEdit	Occurs before a row begins to be edited. A row begins to be edited when one cell of the row begins editing and there was not previously editing cells in the row.
	BindingValidationError	(Inherited from System.Windows.FrameworkElement)
	CanceledNewRow	Occurs after the editing of a new row has been canceled.
	CanceledRowEdit	Occurs after a row editing has been canceled.
	CancelingEdit	Occurs before a cell change is canceled.
	CancelingNewRow	Occurs when a new row is canceled.
	CancelingRowEdit	Occurs before a row editing is canceled. A row editing is cancelled when the user press escape. Notice that whether escape is pressed on an editing cell the action will cancel the editing of the cell, if escape is pressed again the changes in the whole row will be reverted.
	ColumnHeaderDragCompleted	Occurs when a column header drag operation finish.
	ColumnHeaderDragDelta	Occurs when a column header is being dragged.
	ColumnHeaderDragStarted	Occurs when a column header drag operation started.
	ColumnReordered	Occurs after a move column operation is committed. The move operation can be started by the user when it drops a column header in a new position or when MoveColumn method is called.
	ColumnReordering	Occurs before a move column operation is committed. The move operation can be started by the user when it drops a column header in a new position or when MoveColumn method is called.

	ColumnResized	Occurs when the user release the mouse after dragging the border on the right of the column header.
	ColumnResizing	Occurs while the user is resizing a column by dragging the border on the right of the column header.
	CommittedEdit	Occurs after a cell editing has been committed.
	CommittedNewRow	Occurs after a new row is committed.
	CommittedRowEdit	Occurs after a row editing has been committed. A row editing is committed when a cell of the row has been previously edited and the current cell is changed to a cell which does not belong to the edited row.
	CommittingEdit	Occurs before a cell change is committed.
	CommittingNewRow	Occurs before a new row is committed, allowing to cancel the action.
	CommittingRowEdit	Occurs before a row editing is committed. A row editing is committed when a cell of the row has been previously edited and the current cell is changed to a cell which does not belong to the edited row.
	CreatingRow	Occurs when a row is being created in the model, so you can override the creation returning a different row type.
	CurrentCellChanged	Occurs when a different cell becomes the current cell. Typically this occurs when a user clicks a cell, but it can be set programmatically too by setting CurrentRow and CurrentColumn.
	DataContextChanged	(Inherited from System.Windows.FrameworkElement)
	DeletingRows	Occurs before a deletion of rows happens.

	DragEnter	(Inherited from System.Windows.UIElement)
	DragLeave	(Inherited from System.Windows.UIElement)
	DragOver	(Inherited from System.Windows.UIElement)
	Drop	(Inherited from System.Windows.UIElement)
	FilterChanged	Occurs after the filtering state changed.
	FilterChanging	Occurs before the filter state of C1DataGrid is changed.
	FilterLoading	Occurs before the filter of a column is loaded allowing to change the filter that will be displayed to the user.
	FilterOpened	Occurs when the filter of a column is opened by clicking the button on the right side of the column header.
	FrozenBottomRowsCountChanged	Event raised when the **FrozenBottomRowsCount** property has changed.
	FrozenColumnCountChanged	Event raised when the **FrozenColumnCount** property has changed.
	FrozenTopRowsCountChanged	Event raised when the **FrozenTopRowsCount** property has changed.
	GotFocus	(Inherited from System.Windows.UIElement)
	GroupChanged	Occurs after the grouping state changed.
	GroupChanging	Occurs before the grouping state of the C1DataGrid is changed.
	IsEnabledChanged	(Inherited from System.Windows.Controls.Control)

	IsLoadingChanged	Event raised when the **IsLoading** property has changed.
	IsMouseOverChanged	Event raised when the **IsMouseOver** property has changed.
	KeyDown	Occurs when a keyboard key is pressed while the **System.Windows.UIElement** has focus.
	KeyUp	(Inherited from System.Windows.UIElement)
	LayoutUpdated	(Inherited from System.Windows.FrameworkElement)
	LeadingColumnWidthChanged	Event raised when the **LeadingColumnWidth** property has changed.
	Loaded	(Inherited from System.Windows.FrameworkElement)
	LoadedCellPresenter	Occurs after the visual element of the cell is added to the visual tree and is ready for interaction.
	LoadedColumnHeaderPresenter	Occurs after the column header presenter is added in the visual tree and is ready for interaction.
	LoadedRowDetailsPresenter	Occurs after the visual element of the row details is added in the visual tree and is ready for interaction.
	LoadedRowHeaderPresenter	Occurs after the visual element of the row header is added to the visual tree and is ready for interaction.
	LoadedRowPresenter	Occurs after the visual element of the row is added in the visual tree and is ready for interaction.
	LoadingRow	Occurs when a data item is being loaded in the model This might happen both by bringing the row into view or requesting the row programmatically.

	LostFocus	(Inherited from System.Windows.UIElement)
	LostMouseCapture	(Inherited from System.Windows.UIElement)
	MediaCommand	(Inherited from System.Windows.UIElement)
	MergingCells	Occurs after the measuring the cells, so that the user can combine adjacent cells. In order to merge the cells you should call the method Merge of the DataGridMergingCellsEventArgs passed in.
	MouseEnter	(Inherited from System.Windows.UIElement)
	MouseLeave	(Inherited from System.Windows.UIElement)
	MouseLeftButtonDown	(Inherited from System.Windows.UIElement)
	MouseLeftButtonUp	(Inherited from System.Windows.UIElement)
	MouseMove	(Inherited from System.Windows.UIElement)
	MouseRightButtonDown	(Inherited from System.Windows.UIElement)
	MouseRightButtonUp	(Inherited from System.Windows.UIElement)
	MouseWheel	(Inherited from System.Windows.UIElement)
	PropertyChanged	Occurs when a property value changes.
	RowDetailsVisibilityChanged	Occurs when the visibility of a row details changed.
	RowResized	Occurs when the user release the mouse after dragging the border at the bottom of the column header.
	RowResizing	Occurs while the user is resizing a row by dragging the border at the bottom of the row header.
	RowsAdded	Occurs after new rows have been added to the

		C1DataGrid.
	RowsDeleted	Occurs after rows have been deleted from the C1DataGrid.
	SelectionChanged	Occurs when the SelectedItem or SelectedItems property value changes.
	SelectionChanging	Occurs before the selection changes.
	SelectionDragCompleted	Occurs when the mouse drag operation in the area containing the rows is completed.
	SelectionDragDelta	Occurs when the mouse is being dragged in the area containing the rows.
	SelectionDragStarted	Occurs the first time the mouse is dragged in the area containing the rows.
	SizeChanged	(Inherited from System.Windows.FrameworkElement)
	SortChanged	Occurs after the sorting state changed.
	SortChanging	Occurs before the sorting state of C1DataGrid is changed.
	TextInput	(Inherited from System.Windows.UIElement)
	TextInputStart	(Inherited from System.Windows.UIElement)
	TextInputUpdate	(Inherited from System.Windows.UIElement)
	Unloaded	(Inherited from System.Windows.FrameworkElement)
	UnloadedCellPresenter	Occurs before the visual element of a cell is removed from the visual tree.
	UnloadedColumnHeaderPresenter	Occurs before the visual element of a column header is

		removed from the visual tree.
	UnloadedRowDetailsPresenter	Occurs before the visual element of a row details is removed from the visual tree.
	UnloadedRowHeaderPresenter	Occurs before the visual element of a row header is removed from the visual tree.
	UnloadedRowPresenter	Occurs before the visual element of a row is removed from the visual tree.
	UnloadingRow	Occurs after a row is unloaded from the model.

AutoGeneratedColumns Event

Occurs after all the auto-generated columns are created.

Syntax

Visual Basic (Declaration)

```
Public Event AutoGeneratedColumns As System.EventHandler
```

C#

```
public event System.EventHandler AutoGeneratedColumns
```

Remarks

You can use this event to reorder the auto-generated columns by setting the DataGridColumn.DisplayIndex of the columns.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

AutoGeneratingColumn Event

Occurs when the auto-generated columns are being created.

Syntax

Visual Basic (Declaration)
`Public Event AutoGeneratingColumn As System.EventHandler(Of DataGridAutoGeneratingColumnEventArgs)`
C#
`public event System.EventHandler<DataGridAutoGeneratingColumnEventArgs> AutoGeneratingColumn`

Event Data

The event handler receives an argument of type DataGridAutoGeneratingColumnEventArgs containing data related to this event. The following **DataGridAutoGeneratingColumnEventArgs** properties provide information specific to this event.

Property	Description
Cancel	Gets or sets a value indicating whether the event is canceled.
Column	Gets or sets the column that is being generated.
Property	Gets or sets the property info corresponding to the generated column.

Remarks

You can change the auto-generated column by setting the property DataGridAutoGeneratingColumnEventArgs.Column. You can cancel an auto-generated column

by setting the property DataGridAutoGeneratingColumnEventArgs.Cancel to true, in this case there will not be column for this property.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

BeganEdit Event
Occurs after a cell began to be edited.

Syntax

Visual Basic (Declaration)
`Public Event BeganEdit As System.EventHandler(Of DataGridBeganEditEventArgs)`
C#
`public event System.EventHandler<DataGridBeganEditEventArgs> BeganEdit`

Event Data

The event handler receives an argument of type DataGridBeganEditEventArgs containing data related to this event. The following **DataGridBeganEditEventArgs** properties provide information specific to this event.

Property	Description
Column	Gets the column corresponding to the editing cell.
EditingElement	Gets the editing ui element.
Row	Gets the row corresponding to the editing cell.

Remarks

This event typically occurs when the user press F2 over a cell or click a cell or a row that already contains the current cell. This event can be used to modify the editing control.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

BeginningEdit Event
Occurs before a cell begins to be edited.

Syntax

Visual Basic (Declaration)
`Public Event BeginningEdit As System.EventHandler(Of DataGridBeginningEditEventArgs)`
C#
`public event System.EventHandler<DataGridBeginningEditEventArgs> BeginningEdit`

Event Data

The event handler receives an argument of type DataGridBeginningEditEventArgs containing data related to this event. The following **DataGridBeginningEditEventArgs** properties provide information specific to this event.

Property	Description
Cancel	Gets or sets a value indicating whether the event is canceled.
Column	Gets the column corresponding to the editing cell.
Row	Gets the row corresponding to the editing cell.

Remarks

This event typically occurs when the user press F2 over a cell or click a cell or a row that already contains the current cell. You can cancel the event setting DataGridBeginningEditEventArgs.Cancel to true.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

BeginningNewRow Event

Occurs when a new row begins to be edited.

Syntax

Visual Basic (Declaration)
`Public Event BeginningNewRow As System.EventHandler(Of DataGridBeginningNewRowEventArgs)`
C#
`public event System.EventHandler<DataGridBeginningNewRowEventArgs> BeginningNewRow`

Event Data

The event handler receives an argument of type DataGridBeginningNewRowEventArgs containing data related to this event. The following **DataGridBeginningNewRowEventArgs** properties provide information specific to this event.

Property	Description
Cancel	Gets or sets a value indicating whether the event is canceled.
Item	Gets or sets the data item corresponding to the new row.

NewRow	Gets the new row.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

BeginningRowEdit Event

Occurs before a row begins to be edited. A row begins to be edited when one cell of the row begins editing and there was not previously editing cells in the row.

Syntax

Visual Basic (Declaration)
`Public Event BeginningRowEdit As System.EventHandler(Of DataGridEditingRowEventArgs)`
C#
`public event System.EventHandler<DataGridEditingRowEventArgs> BeginningRowEdit`

Event Data

The event handler receives an argument of type DataGridEditingRowEventArgs containing data related to this event. The following **DataGridEditingRowEventArgs** properties provide information specific to this event.

Property	Description
Cancel	Gets or sets a value indicating whether this DataGridEditingRowEventArgs is canceled.
Row	Gets the row. (Inherited from C1.Silverlight.DataGrid.DataGridRowEventArgs)

Remarks

You can cancel the event setting DataGridEditingRowEventArgs.Cancel to true.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CanceledNewRow Event

Occurs after the editing of a new row has been canceled.

Syntax

Visual Basic (Declaration)	
`Public Event CanceledNewRow As System.EventHandler(Of DataGridRowEventArgs)`	
C#	
`public event System.EventHandler<DataGridRowEventArgs> CanceledNewRow`	

Event Data

The event handler receives an argument of type DataGridRowEventArgs containing data related to this event. The following **DataGridRowEventArgs** properties provide information specific to this event.

Property	Description
Row	Gets the row.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CanceledRowEdit Event

Occurs after a row editing has been canceled.

Syntax

Visual Basic (Declaration)
`Public Event CanceledRowEdit As System.EventHandler(Of DataGridRowEventArgs)`
C#
`public event System.EventHandler<DataGridRowEventArgs> CanceledRowEdit`

Event Data

The event handler receives an argument of type DataGridRowEventArgs containing data related to this event. The following **DataGridRowEventArgs** properties provide information specific to this event.

Property	Description
Row	Gets the row.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CancelingEdit Event

Occurs before a cell change is canceled.

Syntax

Visual Basic (Declaration)	
`Public Event CancelingEdit As System.EventHandler(Of DataGridEndingEditEventArgs)`	
C#	
`public event System.EventHandler<DataGridEndingEditEventArgs> CancelingEdit`	

Event Data

The event handler receives an argument of type DataGridEndingEditEventArgs containing data related to this event. The following **DataGridEndingEditEventArgs** properties provide information specific to this event.

Property	Description
Cancel	Gets or sets a value indicating whether the event is canceled.
Column	Gets the column corresponding to the editing cell.
EditingElement	Gets the editing **System.Windows.FrameworkElement**.
Row	Gets the row corresponding to the editing cell.

Remarks

This event typically occurs when the user press escape in an editing cell. You can cancel the event setting DataGridEndingEditEventArgs.Cancel to true.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CancelingNewRow Event
Occurs when a new row is canceled.

Syntax

Visual Basic (Declaration)	
`Public Event CancelingNewRow As System.EventHandler(Of DataGridEndingNewRowEventArgs)`	
C#	
`public event System.EventHandler<DataGridEndingNewRowEventArgs> CancelingNewRow`	

Event Data

The event handler receives an argument of type DataGridEndingNewRowEventArgs containing data related to this event. The following **DataGridEndingNewRowEventArgs** properties provide information specific to this event.

Property	Description
Cancel	Gets or sets a value indicating whether the event is canceled.
NewRow	Gets the new row.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CancelingRowEdit Event

Occurs before a row editing is canceled. A row editing is cancelled when the user press escape. Notice that whether escape is pressed on an editing cell the action will cancel the editing of the cell, if escape is pressed again the changes in the whole row will be reverted.

Syntax

Visual Basic (Declaration)	
`Public Event CancelingRowEdit As System.EventHandler(Of DataGridEditingRowEventArgs)`	
C#	
`public event System.EventHandler<DataGridEditingRowEventArgs> CancelingRowEdit`	

Event Data

The event handler receives an argument of type DataGridEditingRowEventArgs containing data related to this event. The following **DataGridEditingRowEventArgs** properties provide information specific to this event.

Property	Description
Cancel	Gets or sets a value indicating whether this DataGridEditingRowEventArgs is canceled.
Row	Gets the row. (Inherited from C1.Silverlight.DataGrid.DataGridRowEventArgs)

Remarks

You can cancel the event setting DataGridEditingRowEventArgs.Cancel to true.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ColumnHeaderDragCompleted Event
Occurs when a column header drag operation finish.

Syntax

Visual Basic (Declaration)	
`Public Event ColumnHeaderDragCompleted As System.EventHandler(Of C1DragCompletedEventArgs)`	
C#	
`public event System.EventHandler<C1DragCompletedEventArgs> ColumnHeaderDragCompleted`	

Event Data

The event handler receives an argument of type C1.Silverlight.C1DragCompletedEventArgs containing data related to this event. The following **C1DragCompletedEventArgs** properties provide information specific to this event.

Property	Description
CumulativeTranslation	
DragHelper	(Inherited from C1.Silverlight.C1DragEventArgs)
Handled	(Inherited from C1.Silverlight.C1InputEventArgs)
OriginalEventArgs	(Inherited from C1.Silverlight.C1InputEventArgs)
OriginalSource	(Inherited from C1.Silverlight.C1InputEventArgs)
PointerDeviceType	(Inherited from C1.Silverlight.C1InputEventArgs)

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ColumnHeaderDragDelta Event

Occurs when a column header is being dragged.

Syntax

Visual Basic (Declaration)	
`Public Event ColumnHeaderDragDelta As System.EventHandler(Of C1DragDeltaEventArgs)`	
C#	
`public event System.EventHandler<C1DragDeltaEventArgs> ColumnHeaderDragDelta`	

Event Data

The event handler receives an argument of type C1.Silverlight.C1DragDeltaEventArgs containing data related to this event. The following **C1DragDeltaEventArgs** properties provide information specific to this event.

Property	Description
CumulativeTranslation	
DeltaTranslation	
DragHelper	(Inherited from C1.Silverlight.C1DragEventArgs)
Handled	(Inherited from C1.Silverlight.C1InputEventArgs)
IsInertial	
OriginalEventArgs	(Inherited from C1.Silverlight.C1InputEventArgs)
OriginalSource	(Inherited from C1.Silverlight.C1InputEventArgs)
PointerDeviceType	(Inherited from C1.Silverlight.C1InputEventArgs)

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ColumnHeaderDragStarted Event
Occurs when a column header drag operation started.

Syntax

Visual Basic (Declaration)
`Public Event ColumnHeaderDragStarted As System.EventHandler(Of C1DragStartedEventArgs)`
C#
`public event System.EventHandler<C1DragStartedEventArgs> ColumnHeaderDragStarted`

Event Data

The event handler receives an argument of type C1.Silverlight.C1DragStartedEventArgs containing data related to this event. The following **C1DragStartedEventArgs** properties provide information specific to this event.

Property	Description
DragHelper	(Inherited from C1.Silverlight.C1DragEventArgs)
Handled	(Inherited from C1.Silverlight.C1InputEventArgs)
Origin	
OriginalEventArgs	(Inherited from C1.Silverlight.C1InputEventArgs)
OriginalSource	(Inherited from C1.Silverlight.C1InputEventArgs)
PointerDeviceType	(Inherited from C1.Silverlight.C1InputEventArgs)

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ColumnReordered Event

Occurs after a move column operation is committed. The move operation can be started by the user when it drops a column header in a new position or when MoveColumn method is called.

Syntax

Visual Basic (Declaration)	
`Public Event ColumnReordered As System.EventHandler(Of DataGridColumnEventArgs)`	
C#	
`public event System.EventHandler<DataGridColumnEventArgs> ColumnReordered`	

Event Data

The event handler receives an argument of type DataGridColumnEventArgs containing data related to this event. The following **DataGridColumnEventArgs** properties provide information specific to this event.

Property	Description
Column	Gets the column.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ColumnReordering Event

Occurs before a move column operation is committed. The move operation can be started by the user when it drops a column header in a new position or when MoveColumn method is called.

Syntax

Visual Basic (Declaration)

```
Public Event ColumnReordering As System.EventHandler(Of
DataGridColumnReorderingEventArgs)
```

C#

```
public event System.EventHandler<DataGridColumnReorderingEventArgs>
ColumnReordering
```

Event Data

The event handler receives an argument of type DataGridColumnReorderingEventArgs containing data related to this event. The following **DataGridColumnReorderingEventArgs** properties provide information specific to this event.

Property	Description
Cancel	Gets or sets a value indicating whether the event is canceled.
Column	Gets the reordering column.
TargetColumnIndex	Gets or sets the target index of the column.

Remarks

The move operation can be cancelled by setting DataGridColumnReorderingEventArgs.Cancel property of the event arguments to true;

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ColumnResized Event

Occurs when the user release the mouse after dragging the border on the right of the column header.

Syntax

Visual Basic (Declaration)
`Public Event ColumnResized As System.EventHandler(Of DataGridColumnEventArgs)`
C#
`public event System.EventHandler<DataGridColumnEventArgs> ColumnResized`

Event Data

The event handler receives an argument of type DataGridColumnEventArgs containing data related to this event. The following **DataGridColumnEventArgs** properties provide information specific to this event.

Property	Description
Column	Gets the column.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ColumnResizing Event

Occurs while the user is resizing a column by dragging the border on the right of the column header.

Syntax

Visual Basic (Declaration)	
`Public Event ColumnResizing As System.EventHandler(Of DataGridColumnEventArgs)`	
C#	
`public event System.EventHandler<DataGridColumnEventArgs> ColumnResizing`	

Event Data

The event handler receives an argument of type DataGridColumnEventArgs containing data related to this event. The following **DataGridColumnEventArgs** properties provide information specific to this event.

Property	Description
Column	Gets the column.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CommittedEdit Event

Occurs after a cell editing has been committed.

Syntax

Visual Basic (Declaration)	

```
Public Event CommittedEdit As System.EventHandler(Of DataGridCellEventArgs)
```

C#

```
public event System.EventHandler<DataGridCellEventArgs> CommittedEdit
```

Event Data

The event handler receives an argument of type DataGridCellEventArgs containing data related to this event. The following **DataGridCellEventArgs** properties provide information specific to this event.

Property	Description
Cell	Gets the cell.

Remarks

This event typically occurs when the user press enter or tab in an editing cell.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CommittedNewRow Event

Occurs after a new row is committed.

Syntax

Visual Basic (Declaration)

```
Public Event CommittedNewRow As System.EventHandler(Of DataGridRowEventArgs)
```

C#

```
public event System.EventHandler<DataGridRowEventArgs> CommittedNewRow
```

Event Data

The event handler receives an argument of type DataGridRowEventArgs containing data related to this event. The following **DataGridRowEventArgs** properties provide information specific to this event.

Property	Description
Row	Gets the row.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CommittedRowEdit Event

Occurs after a row editing has been committed. A row editing is committed when a cell of the row has been previously edited and the current cell is changed to a cell which does not belong to the edited row.

Syntax

Visual Basic (Declaration)
`Public Event CommittedRowEdit As System.EventHandler(Of DataGridRowEventArgs)`
C#
`public event System.EventHandler<DataGridRowEventArgs> CommittedRowEdit`

Event Data

The event handler receives an argument of type DataGridRowEventArgs containing data related to this event. The following **DataGridRowEventArgs** properties provide information specific to this event.

Property	Description
Row	Gets the row.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CommittingEdit Event
Occurs before a cell change is committed.

Syntax

Visual Basic (Declaration)
`Public Event CommittingEdit As System.EventHandler(Of DataGridEndingEditEventArgs)`
C#
`public event System.EventHandler<DataGridEndingEditEventArgs> CommittingEdit`

Event Data

The event handler receives an argument of type DataGridEndingEditEventArgs containing data related to this event. The following **DataGridEndingEditEventArgs** properties provide information specific to this event.

Property	Description
Cancel	Gets or sets a value indicating whether the event is canceled.
Column	Gets the column corresponding to the editing cell.
EditingElement	Gets the editing **System.Windows.FrameworkElement**.
Row	Gets the row corresponding to the editing cell.

Remarks

This event typically occurs when the user press enter or tab in an editing cell. You can cancel the event setting DataGridEndingEditEventArgs.Cancel to true.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CommittingNewRow Event
Occurs before a new row is committed, allowing to cancel the action.

Syntax

Visual Basic (Declaration)

```
Public Event CommittingNewRow As System.EventHandler(Of
DataGridEndingNewRowEventArgs)
```

C#

```
public event System.EventHandler<DataGridEndingNewRowEventArgs>
CommittingNewRow
```

Event Data

The event handler receives an argument of type DataGridEndingNewRowEventArgs containing data related to this event. The following **DataGridEndingNewRowEventArgs** properties provide information specific to this event.

Property	Description
Cancel	Gets or sets a value indicating whether the event is canceled.
NewRow	Gets the new row.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CommittingRowEdit Event

Occurs before a row editing is committed. A row editing is committed when a cell of the row has been previously edited and the current cell is changed to a cell which does not belong to the edited row.

Syntax

Visual Basic (Declaration)
`Public Event CommittingRowEdit As System.EventHandler(Of DataGridEditingRowEventArgs)`
C#
`public event System.EventHandler<DataGridEditingRowEventArgs> CommittingRowEdit`

Event Data

The event handler receives an argument of type DataGridEditingRowEventArgs containing data related to this event. The following **DataGridEditingRowEventArgs** properties provide information specific to this event.

Property	Description
Cancel	Gets or sets a value indicating whether this DataGridEditingRowEventArgs is canceled.
Row	Gets the row. (Inherited from C1.Silverlight.DataGrid.DataGridRowEventArgs)

Remarks

You can cancel the event setting DataGridEditingRowEventArgs.Cancel to true.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CreatingRow Event
Occurs when a row is being created in the model, so you can override the creation returning a different row type.

Syntax

Visual Basic (Declaration)
`Public Event CreatingRow As System.EventHandler(Of DataGridCreatingRowEventArgs)`
C#
`public event System.EventHandler<DataGridCreatingRowEventArgs> CreatingRow`

Event Data

The event handler receives an argument of type DataGridCreatingRowEventArgs containing data related to this event. The following **DataGridCreatingRowEventArgs** properties provide information specific to this event.

Property	Description
DataItem	Gets the data item associated with this row.
Row	Gets or sets the row that will be used.
Type	Gets the type of row.

Remarks

Typically used to inject custom rows like SummaryRow, TemplateRow, etc

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CurrentCellChanged Event

Occurs when a different cell becomes the current cell. Typically this occurs when a user clicks a cell, but it can be set programmatically too by setting CurrentRow and CurrentColumn.

Syntax

Visual Basic (Declaration)
`Public Event CurrentCellChanged As System.EventHandler(Of DataGridCellEventArgs)`
C#
`public event System.EventHandler<DataGridCellEventArgs> CurrentCellChanged`

Event Data

The event handler receives an argument of type DataGridCellEventArgs containing data related to this event. The following **DataGridCellEventArgs** properties provide information specific to this event.

Property	Description
Cell	Gets the cell.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

DeletingRows Event
Occurs before a deletion of rows happens.

Syntax

Visual Basic (Declaration)	
`Public Event DeletingRows As System.EventHandler(Of DataGridDeletingRowsEventArgs)`	
C#	
`public event System.EventHandler<DataGridDeletingRowsEventArgs> DeletingRows`	

Event Data

The event handler receives an argument of type DataGridDeletingRowsEventArgs containing data related to this event. The following **DataGridDeletingRowsEventArgs** properties provide information specific to this event.

Property	Description
Cancel	Gets or sets a value indicating whether the event is canceled.
DeletedRows	Gets the deleted rows.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

FilterChanged Event
Occurs after the filtering state changed.

Syntax

Visual Basic (Declaration)
`Public Event FilterChanged As System.EventHandler(Of DataGridFilterChangedEventArgs)`
C#
`public event System.EventHandler<DataGridFilterChangedEventArgs> FilterChanged`

Event Data

The event handler receives an argument of type DataGridFilterChangedEventArgs containing data related to this event. The following **DataGridFilterChangedEventArgs** properties provide information specific to this event.

Property	Description
NewFilteredColumns	Gets currently filtered columns.
OldFilteredColumns	Gets previously filtered columns.

Remarks

Filtering state changes when user manipulates the filter included in the column header or when the FilterBy method is called.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

FilterChanging Event
Occurs before the filter state of C1DataGrid is changed.

Syntax

Visual Basic (Declaration)
`Public Event FilterChanging As System.EventHandler(Of DataGridFilterChangingEventArgs)`
C#
`public event System.EventHandler<DataGridFilterChangingEventArgs> FilterChanging`

Event Data

The event handler receives an argument of type DataGridFilterChangingEventArgs containing data related to this event. The following **DataGridFilterChangingEventArgs** properties provide information specific to this event.

Property	Description
Cancel	(Inherited from C1.Silverlight.CancelEventArgs)
ChangingColumns	Gets the columns will be filtered if this event is not cancelled.

Remarks

Filtering state changes when user manipulates the filter included in the column header or when the FilterBy method is called.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

FilterLoading Event
Occurs before the filter of a column is loaded allowing to change the filter that will be displayed to the user.

Syntax

Visual Basic (Declaration)
`Public Event FilterLoading As System.EventHandler(Of DataGridColumnEditableValueEventArgs(Of IDataGridFilter))`
C#
`public event System.EventHandler<DataGridColumnEditableValueEventArgs<IDataGridFilter>> FilterLoading`

Event Data

The event handler receives an argument of type DataGridColumnEditableValueEventArgs<T> containing data related to this event. The following **DataGridColumnEditableValueEventArgs<T>** properties provide information specific to this event.

Property	Description
Column	Gets the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumnEventArgs)
Value	Gets or sets the value associated with the column.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

FilterOpened Event
Occurs when the filter of a column is opened by clicking the button on the right side of the column header.

Syntax

Visual Basic (Declaration)	
`Public Event FilterOpened As System.EventHandler(Of DataGridColumnValueEventArgs(Of IDataGridFilter))`	
C#	
`public event System.EventHandler<DataGridColumnValueEventArgs<IDataGridFilter>> FilterOpened`	

Event Data

The event handler receives an argument of type DataGridColumnValueEventArgs<T> containing data related to this event. The following **DataGridColumnValueEventArgs<T>** properties provide information specific to this event.

Property	Description
Column	Gets the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumnEventArgs)
Value	Gets the value associated with the column.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

FrozenBottomRowsCountChanged Event

Event raised when the **FrozenBottomRowsCount** property has changed.

Syntax

Visual Basic (Declaration)	
`Public Event FrozenBottomRowsCountChanged As System.EventHandler(Of`	

```
PropertyChangedEventArgs(Of Integer))
```

C#

```
public event System.EventHandler<PropertyChangedEventArgs<int>>
FrozenBottomRowsCountChanged
```

Event Data

The event handler receives an argument of type C1.Silverlight.PropertyChangedEventArgs<T> containing data related to this event. The following **PropertyChangedEventArgs<T>** properties provide information specific to this event.

Property	Description
NewValue	
OldValue	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

FrozenColumnCountChanged Event

Event raised when the **FrozenColumnCount** property has changed.

Syntax

Visual Basic (Declaration)

```
Public Event FrozenColumnCountChanged As System.EventHandler(Of
PropertyChangedEventArgs(Of Integer))
```

C#

```
public event System.EventHandler<PropertyChangedEventArgs<int>>
```

```
FrozenColumnCountChanged
```

Event Data

The event handler receives an argument of type C1.Silverlight.PropertyChangedEventArgs<T> containing data related to this event. The following **PropertyChangedEventArgs<T>** properties provide information specific to this event.

Property	Description
NewValue	
OldValue	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

FrozenTopRowsCountChanged Event

Event raised when the **FrozenTopRowsCount** property has changed.

Syntax

Visual Basic (Declaration)
`Public Event FrozenTopRowsCountChanged As System.EventHandler(Of PropertyChangedEventArgs(Of Integer))`
C#
`public event System.EventHandler<PropertyChangedEventArgs<int>> FrozenTopRowsCountChanged`

Event Data

The event handler receives an argument of type C1.Silverlight.PropertyChangedEventArgs<T> containing data related to this event. The following **PropertyChangedEventArgs<T>** properties provide information specific to this event.

Property	Description
NewValue	
OldValue	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GroupChanged Event

Occurs after the grouping state changed.

Syntax

Visual Basic (Declaration)
`Public Event GroupChanged As System.EventHandler(Of DataGridGroupChangedEventArgs)`
C#
`public event System.EventHandler<DataGridGroupChangedEventArgs> GroupChanged`

Event Data

The event handler receives an argument of type DataGridGroupChangedEventArgs containing data related to this event. The following **DataGridGroupChangedEventArgs** properties provide information specific to this event.

Property	Description

NewGroupedColumns	Gets currently grouped columns.
OldGroupedColumns	Gets previously grouped columns.

Remarks

Grouping state changes when user drag a column on the grouping panel or when the GroupBy method is called.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GroupChanging Event
Occurs before the grouping state of the C1DataGrid is changed.

Syntax

Visual Basic (Declaration)
`Public Event GroupChanging As System.EventHandler(Of DataGridGroupChangingEventArgs)`
C#
`public event System.EventHandler<DataGridGroupChangingEventArgs> GroupChanging`

Event Data

The event handler receives an argument of type DataGridGroupChangingEventArgs containing data related to this event. The following **DataGridGroupChangingEventArgs** properties provide information specific to this event.

Property	Description

Cancel	(Inherited from C1.Silverlight.CancelEventArgs)
ChangingColumns	Gets the columns will be grouped if this event is not cancelled.

Remarks

Grouping state changes when user drag a column on the grouping panel or when the GroupBy method is called.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IsLoadingChanged Event

Event raised when the **IsLoading** property has changed.

Syntax

Visual Basic (Declaration)
`Public Event IsLoadingChanged As System.EventHandler(Of PropertyChangedEventArgs(Of Boolean))`
C#
`public event System.EventHandler<PropertyChangedEventArgs<bool>> IsLoadingChanged`

Event Data

The event handler receives an argument of type C1.Silverlight.PropertyChangedEventArgs<T> containing data related to this event. The following **PropertyChangedEventArgs<T>** properties provide information specific to this event.

Property	Description

NewValue	
OldValue	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IsMouseOverChanged Event

Event raised when the **IsMouseOver** property has changed.

Syntax

Visual Basic (Declaration)
`Public Event IsMouseOverChanged As System.EventHandler(Of PropertyChangedEventArgs(Of Boolean))`
C#
`public event System.EventHandler<PropertyChangedEventArgs<bool>> IsMouseOverChanged`

Event Data

The event handler receives an argument of type C1.Silverlight.PropertyChangedEventArgs<T> containing data related to this event. The following **PropertyChangedEventArgs<T>** properties provide information specific to this event.

Property	Description
NewValue	
OldValue	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

KeyDown Event

Occurs when a keyboard key is pressed while the **System.Windows.UIElement** has focus.

Syntax

Visual Basic (Declaration)
`Public Shadows Event KeyDown As System.Windows.Input.KeyEventHandler`
C#
`public new event System.Windows.Input.KeyEventHandler KeyDown`

Event Data

The event handler receives an argument of type System.Windows.Input.KeyEventArgs containing data related to this event. The following **KeyEventArgs** properties provide information specific to this event.

Property	Description
Handled	Gets or sets a value that marks the routed event as handled. A true value for Handled prevents most handlers along the event route from handling the same event again.
Key	Gets the keyboard key associated with the event.
OriginalSource	(Inherited from System.Windows.RoutedEventArgs)
PlatformKeyCode	Gets an integer value that represents the key that is pressed or released (depending on which event is raised). This value is the nonportable key code, which is operating system–specific.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

LeadingColumnWidthChanged Event

Event raised when the **LeadingColumnWidth** property has changed.

Syntax

Visual Basic (Declaration)
`Public Event LeadingColumnWidthChanged As System.EventHandler(Of PropertyChangedEventArgs(Of DataGridLength))`
C#
`public event System.EventHandler<PropertyChangedEventArgs<DataGridLength>> LeadingColumnWidthChanged`

Event Data

The event handler receives an argument of type C1.Silverlight.PropertyChangedEventArgs<T> containing data related to this event. The following **PropertyChangedEventArgs<T>** properties provide information specific to this event.

Property	Description
NewValue	
OldValue	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

LoadedCellPresenter Event

Occurs after the visual element of the cell is added to the visual tree and is ready for interaction.

Syntax

Visual Basic (Declaration)
`Public Event LoadedCellPresenter As System.EventHandler(Of DataGridCellEventArgs)`
C#
`public event System.EventHandler<DataGridCellEventArgs> LoadedCellPresenter`

Event Data

The event handler receives an argument of type DataGridCellEventArgs containing data related to this event. The following **DataGridCellEventArgs** properties provide information specific to this event.

Property	Description
Cell	Gets the cell.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

LoadedColumnHeaderPresenter Event

Occurs after the column header presenter is added in the visual tree and is ready for interaction.

Syntax

Visual Basic (Declaration)	
`Public Event LoadedColumnHeaderPresenter As System.EventHandler(Of DataGridColumnEventArgs)`	
C#	
`public event System.EventHandler<DataGridColumnEventArgs> LoadedColumnHeaderPresenter`	

Event Data

The event handler receives an argument of type DataGridColumnEventArgs containing data related to this event. The following **DataGridColumnEventArgs** properties provide information specific to this event.

Property	Description
Column	Gets the column.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

LoadedRowDetailsPresenter Event

Occurs after the visual element of the row details is added in the visual tree and is ready for interaction.

Syntax

Visual Basic (Declaration)	
`Public Event LoadedRowDetailsPresenter As System.EventHandler(Of DataGridRowDetailsEventArgs)`	

C#

```
public event System.EventHandler<DataGridRowDetailsEventArgs>
LoadedRowDetailsPresenter
```

Event Data

The event handler receives an argument of type DataGridRowDetailsEventArgs containing data related to this event. The following **DataGridRowDetailsEventArgs** properties provide information specific to this event.

Property	Description
DetailsElement	Gets the details of a row.
Row	Gets the row that owns the details.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

LoadedRowHeaderPresenter Event

Occurs after the visual element of the row header is added to the visual tree and is ready for interaction.

Syntax

Visual Basic (Declaration)

```
Public Event LoadedRowHeaderPresenter As System.EventHandler(Of
DataGridRowEventArgs)
```

C#

```
public event System.EventHandler<DataGridRowEventArgs>
LoadedRowHeaderPresenter
```

Event Data

The event handler receives an argument of type DataGridRowEventArgs containing data related to this event. The following **DataGridRowEventArgs** properties provide information specific to this event.

Property	Description
Row	Gets the row.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

LoadedRowPresenter Event
Occurs after the visual element of the row is added in the visual tree and is ready for interaction.

Syntax

Visual Basic (Declaration)
`Public Event LoadedRowPresenter As System.EventHandler(Of DataGridRowEventArgs)`
C#
`public event System.EventHandler<DataGridRowEventArgs> LoadedRowPresenter`

Event Data

The event handler receives an argument of type DataGridRowEventArgs containing data related to this event. The following **DataGridRowEventArgs** properties provide information specific to this event.

Property	Description

Row	Gets the row.

Remarks

Typically used to set visual properties to the row visual element. Please note you might need to unset the visual properties in the UnloadedRowPresenter event.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

LoadingRow Event

Occurs when a data item is being loaded in the model This might happen both by bringing the row into view or requesting the row programmatically.

Syntax

Visual Basic (Declaration)	
`Public Event LoadingRow As System.EventHandler(Of DataGridRowEventArgs)`	
C#	
`public event System.EventHandler<DataGridRowEventArgs> LoadingRow`	

Event Data

The event handler receives an argument of type DataGridRowEventArgs containing data related to this event. The following **DataGridRowEventArgs** properties provide information specific to this event.

Property	Description
Row	Gets the row.

Remarks

Typically used to initialize properties for a particular row.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

MergingCells Event

Occurs after the measuring the cells, so that the user can combine adjacent cells. In order to merge the cells you should call the method Merge of the DataGridMergingCellsEventArgs passed in.

Syntax

Visual Basic (Declaration)
`Public Event MergingCells As System.EventHandler(Of DataGridMergingCellsEventArgs)`
C#
`public event System.EventHandler<DataGridMergingCellsEventArgs> MergingCells`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

PropertyChanged Event

Occurs when a property value changes.

Syntax

Visual Basic (Declaration)	
`Public Event PropertyChanged As System.ComponentModel.PropertyChangedEventHandler`	
C#	
`public event System.ComponentModel.PropertyChangedEventHandler PropertyChanged`	

Event Data

The event handler receives an argument of type System.ComponentModel.PropertyChangedEventArgs containing data related to this event. The following **PropertyChangedEventArgs** properties provide information specific to this event.

Property	Description
PropertyName	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

RowDetailsVisibilityChanged Event

Occurs when the visibility of a row details changed.

Syntax

Visual Basic (Declaration)	
`Public Event RowDetailsVisibilityChanged As System.EventHandler(Of DataGridRowEventArgs)`	

C#

```
public event System.EventHandler<DataGridRowEventArgs>
RowDetailsVisibilityChanged
```

Event Data

The event handler receives an argument of type DataGridRowEventArgs containing data related to this event. The following **DataGridRowEventArgs** properties provide information specific to this event.

Property	Description
Row	Gets the row.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

RowResized Event

Occurs when the user release the mouse after dragging the border at the bottom of the column header.

Syntax

Visual Basic (Declaration)

```
Public Event RowResized As System.EventHandler(Of DataGridRowEventArgs)
```

C#

```
public event System.EventHandler<DataGridRowEventArgs> RowResized
```

Event Data

The event handler receives an argument of type DataGridRowEventArgs containing data related to this event. The following **DataGridRowEventArgs** properties provide information specific to this event.

Property	Description
Row	Gets the row.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

RowResizing Event

Occurs while the user is resizing a row by dragging the border at the bottom of the row header.

Syntax

Visual Basic (Declaration)	
`Public Event RowResizing As System.EventHandler(Of DataGridRowEventArgs)`	
C#	
`public event System.EventHandler<DataGridRowEventArgs> RowResizing`	

Event Data

The event handler receives an argument of type DataGridRowEventArgs containing data related to this event. The following **DataGridRowEventArgs** properties provide information specific to this event.

Property	Description
Row	Gets the row.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

RowsAdded Event

Occurs after new rows have been added to the C1DataGrid.

Syntax

Visual Basic (Declaration)
`Public Event RowsAdded As System.EventHandler(Of DataGridRowsAddedEventArgs)`
C#
`public event System.EventHandler<DataGridRowsAddedEventArgs> RowsAdded`

Event Data

The event handler receives an argument of type DataGridRowsAddedEventArgs containing data related to this event. The following **DataGridRowsAddedEventArgs** properties provide information specific to this event.

Property	Description
AddedRows	Gets the added rows.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

SelectionChanged Event

Occurs when the SelectedItem or SelectedItems property value changes.

Syntax

Visual Basic (Declaration)	
`Public Event SelectionChanged As System.EventHandler(Of`	

```
DataGridSelectionChangedEventArgs)
```

C#

```
public event System.EventHandler<DataGridSelectionChangedEventArgs>
SelectionChanged
```

Event Data

The event handler receives an argument of type DataGridSelectionChangedEventArgs containing data related to this event. The following **DataGridSelectionChangedEventArgs** properties provide information specific to this event.

Property	Description
AddedRanges	Gets the ranges that has been added to the selection.
RemovedRanges	Gets the ranges that has been removed from the selection.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Occurs before the selection changes.

Syntax

Visual Basic (Declaration)

```
Public Event SelectionChanging As System.EventHandler(Of
DataGridSelectionChangedEventArgs)
```

C#

```
public event System.EventHandler<DataGridSelectionChangedEventArgs>
```

```
SelectionChanging
```

Event Data

The event handler receives an argument of type DataGridSelectionChangedEventArgs containing data related to this event. The following **DataGridSelectionChangedEventArgs** properties provide information specific to this event.

Property	Description
AddedRanges	Gets the ranges that has been added to the selection.
RemovedRanges	Gets the ranges that has been removed from the selection.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

SelectionDragCompleted Event

Occurs when the mouse drag operation in the area containing the rows is completed.

Syntax

Visual Basic (Declaration)
`Public Event SelectionDragCompleted As System.EventHandler(Of DataGridSelectionDragEventArgs)`
C#
`public event System.EventHandler<DataGridSelectionDragEventArgs> SelectionDragCompleted`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

SelectionDragDelta Event

Occurs when the mouse is being dragged in the area containing the rows.

Syntax

Visual Basic (Declaration)
`Public Event SelectionDragDelta As System.EventHandler(Of DataGridSelectionDragEventArgs)`
C#
`public event System.EventHandler<DataGridSelectionDragEventArgs> SelectionDragDelta`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

SelectionDragStarted Event

Occurs the first time the mouse is dragged in the area containing the rows.

Syntax

Visual Basic (Declaration)

```
Public Event SelectionDragStarted As System.EventHandler(Of
DataGridSelectionDragStartedEventArgs)
```

C#

```
public event System.EventHandler<DataGridSelectionDragStartedEventArgs>
SelectionDragStarted
```

Event Data

The event handler receives an argument of type DataGridSelectionDragStartedEventArgs containing data related to this event. The following **DataGridSelectionDragStartedEventArgs** properties provide information specific to this event.

Property	Description
Cancel	Gets or sets a value indicating whether the event is canceled.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

SortChanged Event

Occurs after the sorting state changed.

Syntax

Visual Basic (Declaration)

```
Public Event SortChanged As System.EventHandler(Of
DataGridSortChangedEventArgs)
```

C#

```
public event System.EventHandler<DataGridSortChangedEventArgs> SortChanged
```

Event Data

The event handler receives an argument of type DataGridSortChangedEventArgs containing data related to this event. The following **DataGridSortChangedEventArgs** properties provide information specific to this event.

Property	Description
NewSortedColumns	Gets currently sorted columns.
OldSortedColumns	Gets previously sorted columns.

Remarks

Sorting state changes when user click in a column header or when the SortBy method is called.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

SortChanging Event
Occurs before the sorting state of C1DataGrid is changed.

Syntax

Visual Basic (Declaration)
`Public Event SortChanging As System.EventHandler(Of DataGridSortChangingEventArgs)`
C#
`public event System.EventHandler<DataGridSortChangingEventArgs> SortChanging`

Event Data

The event handler receives an argument of type DataGridSortChangingEventArgs containing data related to this event. The following **DataGridSortChangingEventArgs** properties provide information specific to this event.

Property	Description
Cancel	(Inherited from C1.Silverlight.CancelEventArgs)
ChangingColumns	Gets the columns will be sorted if this event is not cancelled.

Remarks

Sorting state changes when user click in a column header or when the SortBy method is called.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

UnloadedCellPresenter Event
Occurs before the visual element of a cell is removed from the visual tree.

Syntax

Visual Basic (Declaration)
`Public Event UnloadedCellPresenter As System.EventHandler(Of DataGridCellEventArgs)`
C#
`public event System.EventHandler<DataGridCellEventArgs> UnloadedCellPresenter`

Event Data

The event handler receives an argument of type DataGridCellEventArgs containing data related to this event. The following **DataGridCellEventArgs** properties provide information specific to this event.

Property	Description

Cell	Gets the cell.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

UnloadedRowDetailsPresenter Event

Occurs before the visual element of a row details is removed from the visual tree.

Syntax

Visual Basic (Declaration)
`Public Event UnloadedRowDetailsPresenter As System.EventHandler(Of DataGridRowDetailsEventArgs)`
C#
`public event System.EventHandler<DataGridRowDetailsEventArgs> UnloadedRowDetailsPresenter`

Event Data

The event handler receives an argument of type DataGridRowDetailsEventArgs containing data related to this event. The following **DataGridRowDetailsEventArgs** properties provide information specific to this event.

Property	Description
DetailsElement	Gets the details of a row.
Row	Gets the row that owns the details.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

BuildFilterPredicate<T> Method

The filter states.

The concatenate operator to use (OR, AND).

Builds the filter predicate from an array of DataGridFilterState values for a set of columns.

Syntax

Visual Basic (Declaration)

```
Public Shared Function BuildFilterPredicate(Of T)( _
   ByVal filterStates() As DataGridColumnValue(Of DataGridFilterState), _
   ByVal concat As DataGridFilterCombination _
) As System.Predicate(Of Object)
```

C#

```
public static System.Predicate<object> BuildFilterPredicate<T>(
   DataGridColumnValue<DataGridFilterState>[] filterStates,
   DataGridFilterCombination concat
)
```

Parameters

filterStates

The filter states.

concat

The concatenate operator to use (OR, AND).

Type Parameters

T

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GetPropertyValue<T> Method

The object to which the property path will be applied.

The property path.

Gets the value of a property from the name of the property for a specified object.

Syntax

Visual Basic (Declaration)

```
Public Shared Function GetPropertyValue(Of T)( _
   ByVal source As System.Object, _
   ByVal propertyPath As System.String _
) As T
```

C#

```
public static T GetPropertyValue<T>(
   System.object source,
   System.string propertyPath
)
```

Parameters

source

The object to which the property path will be applied.

propertyPath

The property path.

Type Parameters

T

Return Value

The resulting object after applying the property path in the specified object.

Remarks

It supports needed and indexed property paths.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

SetRowIndexHeaderBehavior Method

The data grid in which the row index will be displayed.

The behavior.

Sets the behavior to show the row index in the row header.

Syntax

Visual Basic (Declaration)

```
Public Shared Sub SetRowIndexHeaderBehavior( _
   ByVal obj As C1DataGrid, _
   ByVal value As C1RowIndexHeaderBehavior _
)
```

C#

```
public static void SetRowIndexHeaderBehavior(
   C1DataGrid obj,
   C1RowIndexHeaderBehavior value
)
```

Parameters

obj

The data grid in which the row index will be displayed.

value

The behavior.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Public Properties

	Name	Description
	ActualCanUserFilter	Gets a value indicating whether a user can perform a filter operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserGroup	Gets a value indicating whether a user can perform a group operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

	ActualCanUserResize	(Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserSort	Gets a value indicating whether a user can perform a sort operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualFilterMemberPath	Overridden. Gets the actual FilterMemberPath.
	ActualGroupHeader	(Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualSortMemberPath	Overridden. Gets the actual SortMemberPath.
	ActualWidth	Gets the actual width in pixels. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	AllowNull	Gets or sets a value indicating whether the editing control allows null values.
	Binding	Gets or sets the binding object used to bind the visual element against the data.
	CanUserFilter	Gets or sets a value indicating whether the user can filter by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserGroup	Gets or sets a value indicating whether the user can group by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserMove	Gets or sets a value that indicates whether the user can change the column display order by dragging column headers with the mouse. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserResize	Gets or sets whether the user can resize the column by dragging the border on the right of the column header presenter. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserResizeRows	Gets or sets whether the user can resize the rows manipulating cells in this column. (Inherited from

		C1.Silverlight.DataGrid.DataGridColumn)
	CanUserSort	Gets or sets a value indicating whether the user can sort by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CellContentStyle	Gets or sets the style applied to the content of a cell in read mode. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CellEditingContentStyle	Gets or sets the style applied to the content of a cell in edit mode. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CellStyle	Gets or sets the style applied to every cell of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	DataGrid	Gets the owner data grid. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	DefaultConverter	Gets the converter that will be used in each cell.
	Dispatcher	(Inherited from System.Windows.DependencyObject)
	DisplayIndex	Gets or sets the desired index in which the column will be displayed. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	EditOnSelection	Gets or sets a value indicating how the cells enters in edit mode when the user clicks on a cell of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Filter	Gets or sets the filter used in this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	FilterMemberPath	Gets or sets a property name, or a period-delimited hierarchy of property names, that indicates the member to filter by. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	FilterState	Gets the filter state of this column. (Inherited from

		C1.Silverlight.DataGrid.DataGridColumn)
	Format	Gets or sets the format of the content of the cells belonging this column.
	GroupContentConverter	Gets or sets the converter that will be applied to the visual element that is inside the content of each group row. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupContentStyle	Gets or sets the style applied to the title of each group row related to this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupConverter	Gets or sets the converter used to customize the grouping behavior. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupHeader	Gets or sets the header that will appear in the grouping panel as the column header is dragged there. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupState	Gets the grouping state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Header	Gets or sets the content of the header (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HeaderPresenter	Gets the presenter corresponding to the header of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HeaderStyle	Gets or sets the style of the header. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HorizontalAlignment	Gets or sets the horizontal alignment of the cell content regarding the cell. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HorizontalOffset	Gets the horizontal offset in pixels. (Inherited from

		C1.Silverlight.DataGrid.DataGridColumn)
	Index	Gets the index of a column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsAutoGenerated	Gets a value that indicates whether the column is auto-generated. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsEditable	Overridden.
	IsFrozen	Gets a value indicating whether this column is moved out of the viewport when the user scrolls the data grid. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsMouseOver	Gets a value indicating whether the mouse is over the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsReadOnly	Gets or sets whether the cells in the column are read only. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsSelectable	Gets or sets a value indicating whether the user is allowed to set the current cell from this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsSelected	Gets a value indicating whether this column is selected. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	MaxWidth	Gets or sets the maximum width of the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	MinWidth	Gets or sets the minimum width of the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Name	Overridden. Gets or sets the name of the column.
	SortMemberPath	Gets or sets a property name, or a period-delimited hierarchy of property names, that indicates the member to sort by. (Inherited

		from C1.Silverlight.DataGrid.DataGridColumn)
	SortState	Gets the sorting state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Tag	Gets or sets the tag. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	TextTrimming	Gets or sets a value indicating whether the text inside the cell allows trimming.
	TextWrapping	Gets or sets a value indicating whether the text inside the cell allows wrapping.
	VerticalAlignment	Gets or sets the vertical alignment of the cell content regarding the cell. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Visibility	Gets or sets whether the column is visible. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Width	Gets or sets the width of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

DataGridBoundColumn Constructor

Overload List

Overload	Description
DataGridBoundColumn Constructor()	Initializes a new instance of a DataGridBoundColumn.
DataGridBoundColumn Constructor(PropertyInfo)	Initializes a new instance of the DataGridBoundColumn class.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Overload List

DataGridBoundColumn Constructor(PropertyInfo)

The property info is used to initialize the column.

Initializes a new instance of the DataGridBoundColumn class.

Syntax

Visual Basic (Declaration)

```
Public Function New( _
   ByVal property As System.Reflection.PropertyInfo _
)
```

C#

```
public DataGridBoundColumn(
   System.Reflection.PropertyInfo property
)
```

Parameters

property

The property info is used to initialize the column.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

BeginEdit Method

Syntax

Visual Basic (Declaration)

```
Public Overrides Function BeginEdit( _
   ByVal editingElement As System.Windows.FrameworkElement, _
   ByVal routedEventArgs As System.Windows.RoutedEventArgs _
) As System.Boolean
```

C#

```
public override System.bool BeginEdit(
   System.Windows.FrameworkElement editingElement,
   System.Windows.RoutedEventArgs routedEventArgs
)
```

Parameters

editingElement

routedEventArgs

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

BindCellContent Method

Syntax

Visual Basic (Declaration)

```
Public Overrides Sub BindCellContent( _
   ByVal cellContent As System.Windows.FrameworkElement, _
   ByVal row As DataGridRow _
)
```

C#

```
public override void BindCellContent(
   System.Windows.FrameworkElement cellContent,
   DataGridRow row
)
```

Parameters

cellContent

row

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CancelCellEdit Method

Syntax

Visual Basic (Declaration)

```
Public Overrides Sub CancelCellEdit( _
   ByVal editingElement As System.Windows.FrameworkElement, _
   ByVal uneditedValue As System.Object _
)
```

C#

```
public override void CancelCellEdit(
   System.Windows.FrameworkElement editingElement,
   System.object uneditedValue
)
```

Parameters

editingElement

uneditedValue

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CreateCellContent Method

Gets a TextBlock that will be used to display the info inside a cell of this column.

Syntax

Visual Basic (Declaration)

```
Public Overrides Function CreateCellContent( _
   ByVal row As DataGridRow _
) As System.Windows.FrameworkElement
```

C#

```
public override System.Windows.FrameworkElement CreateCellContent(
   DataGridRow row
)
```

Parameters

row

Return Value

TextBlock that represent the cell content.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

EndEdit Method

Syntax

Visual Basic (Declaration)

```
Public Overrides Sub EndEdit( _
   ByVal editingElement As System.Windows.FrameworkElement _
)
```

C#

```
public override void EndEdit(
   System.Windows.FrameworkElement editingElement
)
```

Parameters

editingElement

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GetActualFormat Method

Gets the format that will be applied in the column considering different sources like Format property or StringFormat of the Binding property.

Syntax

Visual Basic (Declaration)

```
Public Overridable Function GetActualFormat() As System.String
```

C#

```
public virtual System.string GetActualFormat()
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GetCellContentRecyclingKey Method

Syntax

Visual Basic (Declaration)

```
Public Overrides Function GetCellContentRecyclingKey( _
   ByVal row As DataGridRow _
) As System.Object
```

C#

```
public override System.object GetCellContentRecyclingKey(
   DataGridRow row
)
```

Parameters

row

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

For a list of all members of this type, see DataGridBoundColumn members.

Public Properties

	Name	Description
	ActualCanUserFilter	Gets a value indicating whether a user can perform a filter operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserGroup	Gets a value indicating whether a user can perform a group operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserResize	(Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserSort	Gets a value indicating whether a user can perform a sort operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualFilterMemberPath	Overridden. Gets the actual FilterMemberPath.

	ActualGroupHeader	(Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualSortMemberPath	Overridden. Gets the actual SortMemberPath.
	ActualWidth	Gets the actual width in pixels. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	AllowNull	Gets or sets a value indicating whether the editing control allows null values.
	Binding	Gets or sets the binding object used to bind the visual element against the data.
	CanUserFilter	Gets or sets a value indicating whether the user can filter by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserGroup	Gets or sets a value indicating whether the user can group by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserMove	Gets or sets a value that indicates whether the user can change the column display order by dragging column headers with the mouse. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserResize	Gets or sets whether the user can resize the column by dragging the border on the right of the column header presenter. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserResizeRows	Gets or sets whether the user can resize the rows manipulating cells in this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserSort	Gets or sets a value indicating whether the user can sort by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CellContentStyle	Gets or sets the style applied to the content of a cell in read mode. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

	CellEditingContentStyle	Gets or sets the style applied to the content of a cell in edit mode. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CellStyle	Gets or sets the style applied to every cell of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	DataGrid	Gets the owner data grid. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	DefaultConverter	Gets the converter that will be used in each cell.
	Dispatcher	(Inherited from System.Windows.DependencyObject)
	DisplayIndex	Gets or sets the desired index in which the column will be displayed. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	EditOnSelection	Gets or sets a value indicating how the cells enters in edit mode when the user clicks on a cell of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Filter	Gets or sets the filter used in this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	FilterMemberPath	Gets or sets a property name, or a period-delimited hierarchy of property names, that indicates the member to filter by. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	FilterState	Gets the filter state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Format	Gets or sets the format of the content of the cells belonging this column.
	GroupContentConverter	Gets or sets the converter that will be applied to the visual element that is inside the content of each group row. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

	GroupContentStyle	Gets or sets the style applied to the title of each group row related to this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupConverter	Gets or sets the converter used to customize the grouping behavior. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupHeader	Gets or sets the header that will appear in the grouping panel as the column header is dragged there. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupState	Gets the grouping state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Header	Gets or sets the content of the header (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HeaderPresenter	Gets the presenter corresponding to the header of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HeaderStyle	Gets or sets the style of the header. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HorizontalAlignment	Gets or sets the horizontal alignment of the cell content regarding the cell. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HorizontalOffset	Gets the horizontal offset in pixels. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Index	Gets the index of a column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsAutoGenerated	Gets a value that indicates whether the column is auto-generated. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsEditable	Overridden.

	IsFrozen	Gets a value indicating whether this column is moved out of the viewport when the user scrolls the data grid. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsMouseOver	Gets a value indicating whether the mouse is over the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsReadOnly	Gets or sets whether the cells in the column are read only. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsSelectable	Gets or sets a value indicating whether the user is allowed to set the current cell from this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsSelected	Gets a value indicating whether this column is selected. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	MaxWidth	Gets or sets the maximum width of the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	MinWidth	Gets or sets the minimum width of the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Name	Overridden. Gets or sets the name of the column.
	SortMemberPath	Gets or sets a property name, or a period-delimited hierarchy of property names, that indicates the member to sort by. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	SortState	Gets the sorting state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Tag	Gets or sets the tag. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	TextTrimming	Gets or sets a value indicating whether the text inside the cell allows trimming.

	TextWrapping	Gets or sets a value indicating whether the text inside the cell allows wrapping.
	VerticalAlignment	Gets or sets the vertical alignment of the cell content regarding the cell. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Visibility	Gets or sets whether the column is visible. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Width	Gets or sets the width of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

ActualFilterMemberPath Property

Gets the actual FilterMemberPath.

Syntax

Visual Basic (Declaration)

```
Public Overrides ReadOnly Property ActualFilterMemberPath As System.String
```

C#

```
public override System.string ActualFilterMemberPath {get;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ActualSortMemberPath Property

Gets the actual SortMemberPath.

Syntax

Visual Basic (Declaration)

```
Public Overrides ReadOnly Property ActualSortMemberPath As System.String
```

C#

```
public override System.string ActualSortMemberPath {get;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

AllowNull Property

Gets or sets a value indicating whether the editing control allows null values.

Syntax

Visual Basic (Declaration)

```
Public Property AllowNull As System.Boolean
```

C#

```
public System.bool AllowNull {get; set;}
```

Property Value

`true` if the editing control allows null values; otherwise, `false`.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Binding Property

Gets or sets the binding object used to bind the visual element against the data.

Syntax

Visual Basic (Declaration)

```
Public Property Binding As System.Windows.Data.Binding
```

C#

```
public System.Windows.Data.Binding Binding {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

DefaultConverter Property

Gets the converter that will be used in each cell.

Syntax

Visual Basic (Declaration)

```
Public Overridable ReadOnly Property DefaultConverter As
System.Windows.Data.IValueConverter
```

C#

```
public virtual System.Windows.Data.IValueConverter DefaultConverter {get;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Format Property

Gets or sets the format of the content of the cells belonging this column.

Syntax

Visual Basic (Declaration)

```
Public Overridable Property Format As System.String
```

C#

```
public virtual System.string Format {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Name Property
Gets or sets the name of the column.

Syntax

Visual Basic (Declaration)

```
Public Overrides Property Name As System.String
```

C#

```
public override System.string Name {get; set;}
```

Property Value

The name of the column.

Remarks

This property can be used to access the column in the C1DataGrid columns collection. `grid.Columns["Name of the column"]` If No name is specified, it will take the Binding **System.Windows.Data.Binding.Path** as its name.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

TextTrimming Property

Gets or sets a value indicating whether the text inside the cell allows trimming.

Syntax

Visual Basic (Declaration)

```
Public Property TextTrimming As System.Windows.TextTrimming
```

C#

```
public System.Windows.TextTrimming TextTrimming {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

TextWrapping Property

Gets or sets a value indicating whether the text inside the cell allows wrapping.

Syntax

Visual Basic (Declaration)

```
Public Property TextWrapping As System.Windows.TextWrapping
```

C#

```
public System.Windows.TextWrapping TextWrapping {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Convert Method

The source data being passed to the target.

The **System.Type** of data expected by the target dependency property.

An optional parameter to be used in the converter logic.

The culture of the conversion.

Modifies the source data before passing it to the target for display in the UI.

Syntax

Visual Basic (Declaration)

```
Public Overridable Function Convert( _
   ByVal value As System.Object, _
   ByVal targetType As System.Type, _
   ByVal parameter As System.Object, _
   ByVal culture As System.Globalization.CultureInfo _
) As System.Object
```

C#

```
public virtual System.object Convert(
   System.object value,
   System.Type targetType,
   System.object parameter,
   System.Globalization.CultureInfo culture
)
```

Parameters

value

The source data being passed to the target.

targetType

The **System.Type** of data expected by the target dependency property.

parameter

An optional parameter to be used in the converter logic.

culture

The culture of the conversion.

Return Value

The value to be passed to the target dependency property.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ConvertBack Method

The target data being passed to the source.

The **System.Type** of data expected by the source object.

An optional parameter to be used in the converter logic.

The culture of the conversion.

Modifies the target data before passing it to the source object. This method is called only in **System.Windows.Data.BindingMode.TwoWay** bindings.

Syntax

Visual Basic (Declaration)

```
Public Overridable Function ConvertBack( _
   ByVal value As System.Object, _
   ByVal targetType As System.Type, _
   ByVal parameter As System.Object, _
   ByVal culture As System.Globalization.CultureInfo _
) As System.Object
```

C#

```
public virtual System.object ConvertBack(
```

```
   System.object value,
   System.Type targetType,
   System.object parameter,
   System.Globalization.CultureInfo culture
)
```

Parameters

value

The target data being passed to the source.

targetType

The **System.Type** of data expected by the source object.

parameter

An optional parameter to be used in the converter logic.

culture

The culture of the conversion.

Return Value

The value to be passed to the source object.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Properties Methods

The following tables list the members exposed by DataGridCell.

Public Properties

	Name	Description
	Column	Gets the column.
	DataGrid	Gets the owner data grid.
	IsEditable	Gets a value indicating whether this cell is editable.
	IsEditing	Gets a value indicating whether this cell is being edited.
	IsMouseOver	Gets a value indicating whether the mouse is over the cell.
	IsSelectable	Gets a value indicating whether this cell is selectable.
	IsSelected	Gets a value indicating whether this cell is selected.
	Presenter	Gets the content of the cell.
	Row	Gets the row.

	Text	Gets the text inside the cell.
	Value	Gets the value shown in the cell.

Top

Public Methods

	Name	Description
	Equals	Determines whether the specified **System.Object** is equal to the current **System.Object**.
	GetHashCode	Serves as a hash function for a particular type.
	ToString	Returns a **System.String** that represents the current **System.Object**.

Top

Public Operators

Equality	Implements the operator ==.
Inequality	Implements the operator !=.

Equals Method

The **System.Object** to compare with the current **System.Object**.

Determines whether the specified **System.Object** is equal to the current **System.Object**.

Syntax

Visual Basic (Declaration)

```
Public Overrides Function Equals( _
   ByVal obj As System.Object _
) As System.Boolean
```

C#

```
public override System.bool Equals(
   System.object obj
)
```

Parameters

obj

The **System.Object** to compare with the current **System.Object**.

Return Value

true if the specified **System.Object** is equal to the current **System.Object**; otherwise, false.

Exceptions

Exception	Description
System.NullReferenceException	The obj parameter is null.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GetHashCode Method

Serves as a hash function for a particular type.

Syntax

Visual Basic (Declaration)
`Public Overrides Function GetHashCode() As System.Integer`
C#
`public override System.int GetHashCode()`

Return Value

A hash code for the current **System.Object**.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ToString Method

Returns a **System.String** that represents the current **System.Object**.

Syntax

Visual Basic (Declaration)
`Public Overrides Function ToString() As System.String`
C#
`public override System.string ToString()`

Return Value

A **System.String** that represents the current **System.Object**.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

DataGrid Property

Gets the owner data grid.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property DataGrid As C1DataGrid
```

C#

```
public C1DataGrid DataGrid {get;}
```

Property Value

The owner data grid.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IsSelectable Property

Gets a value indicating whether this cell is selectable.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property IsSelectable As System.Boolean
```

C#

```
public System.bool IsSelectable {get;}
```

Property Value

`true` if this cell is selectable; otherwise, `false`.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IsSelected Property

Gets a value indicating whether this cell is selected.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property IsSelected As System.Boolean
```

C#

```
public System.bool IsSelected {get;}
```

Property Value

`true` if this cell is selected; otherwise, `false`.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Value Property

Gets the value shown in the cell.

Syntax

Visual Basic (Declaration)

```
Public Property Value As System.Object
```

C#

```
public System.object Value {get; set;}
```

Property Value

The value shown the cell.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Operators

Equality Operator

The obj.

The obj2.

Implements the operator ==.

Syntax

Visual Basic (Declaration)

```
Public Operator =( _
   ByVal obj As DataGridCell, _
   ByVal obj2 As DataGridCell _
) As System.Boolean
```

C#

```
public System.bool operator ==(
   DataGridCell obj,
   DataGridCell obj2
)
```

Parameters

obj

The obj.

obj2

The obj2.

Return Value

The result of the operator.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Inequality Operator
The obj.

The obj2.

Implements the operator !=.

Syntax

Visual Basic (Declaration)

```
Public Operator <>( _
   ByVal obj As DataGridCell, _
   ByVal obj2 As DataGridCell _
```

```
) As System.Boolean
```

C#

```
public System.bool operator !=(
   DataGridCell obj,
   DataGridCell obj2
)
```

Parameters

obj

The obj.

obj2

The obj2.

Return Value

The result of the operator.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

OnApplyTemplate Method

Builds the visual tree for the DataGridCellPresenter control when a new template is applied.

Syntax

Visual Basic (Declaration)
`Public Overrides Sub OnApplyTemplate()`
C#
`public override void OnApplyTemplate()`

Remarks

This method is invoked whenever application code or an internal process, such as a rebuilding layout pass, calls the **ApplyTemplate** method.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

DataGrid Property
Gets the data grid which contains the cell.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property DataGrid As C1DataGrid
```

C#

```
public C1DataGrid DataGrid {get;}
```

Property Value

The data grid which contains the cell.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

FocusStyle Property
Gets or sets the style of the focus element which is inside each cell.

Syntax

Visual Basic (Declaration)

```
Public Property FocusStyle As System.Windows.Style
```

C#

```
public System.Windows.Style FocusStyle {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

IsCurrent Property

Gets or sets a value indicating whether this cell is the current cell.

Syntax

Visual Basic (Declaration)

```
Public Property IsCurrent As System.Boolean
```

C#

```
public System.bool IsCurrent {get; set;}
```

Remarks

This property is controlled by the C1DataGrid to which the presenter belongs.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

IsEditing Property

Gets or sets a value indicating whether this cell is currently editing.

Syntax

Visual Basic (Declaration)
`Public Property IsEditing As System.Boolean`
C#
`public System.bool IsEditing {get; set;}`

Remarks

This property is controlled by the C1DataGrid to which the presenter belongs.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IsSelected Property

Gets or sets a value indicating whether this cell is currently selected.

Syntax

Visual Basic (Declaration)

```
Public Property IsSelected As System.Boolean
```

C#

```
public System.bool IsSelected {get; set;}
```

Remarks

This property is controlled by the C1DataGrid to which the presenter belongs.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

MergedRange Property
Gets the merged range this cell belongs to.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property MergedRange As DataGridCellsRange
```

C#

```
public DataGridCellsRange MergedRange {get;}
```

Property Value

The merged range.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

DataGridCellPresenter Members

TopLineBrush Property

Gets or sets the **System.Windows.Media.Brush** used to paint the top line.

Syntax

Visual Basic (Declaration)
`Public Property TopLineBrush As System.Windows.Media.Brush`
C#
`public System.Windows.Media.Brush TopLineBrush {get; set;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ValidationBackground Property

Gets or sets the brush used to paint the background of the validation elements.

Syntax

Visual Basic (Declaration)
`Public Property ValidationBackground As System.Windows.Media.Brush`
C#
`public System.Windows.Media.Brush ValidationBackground {get; set;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ValidationState Property

Gets or sets the ValidationState.

Syntax

Visual Basic (Declaration)

```
Public Property ValidationState As C1.Silverlight.ValidationState
```

C#

```
public C1.Silverlight.ValidationState ValidationState {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Fields

%%scrap%%

" -->

For a list of all members of this type, see DataGridCellPresenter members.

Public Fields

	Name	Description
S	BottomLineBrushProperty	Identifies the BottomLineBrush dependency property.
S	CornerRadiusProperty	Identifies the CornerRadius dependency property.
S	FocusStyleProperty	Identifies the FocusStyle dependency property.
S	IsCurrentProperty	Identifies the IsCurrent dependency property.
S	IsEditingProperty	Identifies the IsEditing dependency property.
S	IsMouseOverProperty	Identifies the IsMouseOver dependency property.
S	IsSelectedProperty	Identifies the IsSelected dependency property.

S	LeftLineBrushProperty	Identifies the LeftLineBrush dependency property.
S	MergedRangeProperty	Identifies the MergedRange dependency property.
S	MouseOverBrushProperty	Identifies the MouseOverBrush dependency property.
S	PressedBrushProperty	Identifies the PressedBrush dependency property.
S	RightLineBrushProperty	Identifies the RightLineBrush dependency property.
S	SelectedBackgroundProperty	Identifies the SelectedBackground dependency property.
S	TopLineBrushProperty	Identifies the TopLineBrush dependency property.
S	ValidationBackgroundProperty	Identifies the ValidationBackground dependency property.
S	ValidationStateProperty	Identifies the ValidationState dependency property.

Reference

IsMouseOverChanged Event

Event raised when the **IsMouseOver** property has changed.

Syntax

Visual Basic (Declaration)
`Public Event IsMouseOverChanged As System.EventHandler(Of PropertyChangedEventArgs(Of Boolean))`
C#
`public event System.EventHandler<PropertyChangedEventArgs<bool>> IsMouseOverChanged`

Event Data

The event handler receives an argument of type C1.Silverlight.PropertyChangedEventArgs<T> containing data related to this event. The following **PropertyChangedEventArgs<T>** properties provide information specific to this event.

Property	Description
NewValue	
OldValue	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

MouseLeftButtonDown Event

Occurs when the left mouse button is pressed (or when the tip of the stylus touches the tablet) while the mouse pointer is over a **System.Windows.UIElement**.

Syntax

Visual Basic (Declaration)
`Public Shadows Event MouseLeftButtonDown As System.Windows.Input.MouseButtonEventHandler`
C#
`public new event System.Windows.Input.MouseButtonEventHandler MouseLeftButtonDown`

Event Data

The event handler receives an argument of type System.Windows.Input.MouseButtonEventArgs containing data related to this event. The following **MouseButtonEventArgs** properties provide information specific to this event.

Property	Description
ClickCount	Gets the number of times the button was clicked.
Handled	Gets or sets a value that marks the routed event as handled. A true value for Handled prevents most handlers along the event route from handling the same event again.
OriginalSource	(Inherited from System.Windows.RoutedEventArgs)
StylusDevice	(Inherited from System.Windows.Input.MouseEventArgs)

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

MouseLeftButtonUp Event

Occurs when the left mouse button is released (or the tip of the stylus is removed from the tablet) while the mouse (or the stylus) is over a **System.Windows.UIElement** (or while a **System.Windows.UIElement** holds mouse capture).

Syntax

Visual Basic (Declaration)
`Public Shadows Event MouseLeftButtonUp As System.Windows.Input.MouseButtonEventHandler`
C#
`public new event System.Windows.Input.MouseButtonEventHandler MouseLeftButtonUp`

Event Data

The event handler receives an argument of type System.Windows.Input.MouseButtonEventArgs containing data related to this event. The following **MouseButtonEventArgs** properties provide information specific to this event.

Property	Description
ClickCount	Gets the number of times the button was clicked.
Handled	Gets or sets a value that marks the routed event as handled. A true value for Handled prevents most handlers along the event route from handling the same event again.
OriginalSource	(Inherited from System.Windows.RoutedEventArgs)
StylusDevice	(Inherited from System.Windows.Input.MouseEventArgs)

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

PropertyChanged Event

Occurs when a property value changes.

Syntax

Visual Basic (Declaration)
`Public Event PropertyChanged As System.ComponentModel.PropertyChangedEventHandler`
C#
`public event System.ComponentModel.PropertyChangedEventHandler PropertyChanged`

Event Data

The event handler receives an argument of type System.ComponentModel.PropertyChangedEventArgs containing data related to this event. The following **PropertyChangedEventArgs** properties provide information specific to this event.

Property	Description
PropertyName	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Members

Properties Methods

The following tables list the members exposed by DataGridCellsRange.

Public Constructors

	Name	Description
	DataGridCellsRange Constructor	Overloaded.

Top

Public Properties

	Name	Description
	BottomRightCell	Gets the bottom right cell.
	Columns	Gets the columns that have some cell belonging to this range.
	IsValid	Gets a value indicating whether this range is valid. The range will be invalid if any of its cells don't belong to the owner data grid.
	Rows	Gets the rows that have some cell belonging to this range.
	TopLeftCell	Gets the top left cell.

Top

Public Methods

	Name	Description
	Contains	Overloaded. Determines whether this range instance contains the specified range.
	Equals	Determines whether the specified **System.Object** is equal to the current **System.Object**.
	GetHashCode	Serves as a hash function for a particular type.

	Intersects	Determines if this range instance intersects the specified range.
	IsSingleCell	Determines whether this range is a single cell.
	IsSingleColumn	Determines whether this range is single column.
	IsSingleRow	Determines whether this range is single row.
	Subtract	Returns an array of ranges which is the result of subtract the specified range to this range instance.
	ToString	Returns a **System.String** that represents this instance.

Top

Public Operators

Equality	Implements the operator ==.
Inequality	Implements the operator !=.

Contains(DataGridCellsRange) Method
The range.

Determines whether this range instance contains the specified range.

Syntax

Visual Basic (Declaration)	

```
Public Overloads Function Contains( _
   ByVal range As DataGridCellsRange _
) As System.Boolean
```

C#

```
public System.bool Contains(
   DataGridCellsRange range
)
```

Parameters

range

The range.

Return Value

`true` if this range instance contains the specified range; otherwise, `false`.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Equals Method

The **System.Object** to compare with the current **System.Object**.

Determines whether the specified **System.Object** is equal to the current **System.Object**.

Syntax

Visual Basic (Declaration)

```
Public Overrides Function Equals( _
   ByVal obj As System.Object _
) As System.Boolean
```

C#

```
public override System.bool Equals(
   System.object obj
)
```

Parameters

obj

The **System.Object** to compare with the current **System.Object**.

Return Value

true if the specified **System.Object** is equal to the current **System.Object**; otherwise, false.

Exceptions

Exception	Description
System.NullReferenceException	The obj parameter is null.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GetHashCode Method

Serves as a hash function for a particular type.

Syntax

Visual Basic (Declaration)

```
Public Overrides Function GetHashCode() As System.Integer
```

C#

```
public override System.int GetHashCode()
```

Return Value

A hash code for the current **System.Object**.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Intersects Method

The range.

Determines if this range instance intersects the specified range.

Syntax

Visual Basic (Declaration)

`Public Function Intersects( _`
`   ByVal range As DataGridCellsRange _`
`) As System.Boolean`

C#

`public System.bool Intersects(`
`   DataGridCellsRange range`
`)`

Parameters

range

The range.

Return Value

`true` if this range instance intersects the specified range; otherwise, `false`.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Subtract Method

The range.

Returns an array of ranges which is the result of subtract the specified range to this range instance.

Syntax

Visual Basic (Declaration)

```
Public Function Subtract( _
   ByVal range As DataGridCellsRange _
) As DataGridCellsRange()
```

C#

```
public DataGridCellsRange[] Subtract(
   DataGridCellsRange range
)
```

Parameters

range

The range.

Return Value

Returns an array of ranges which is the result of subtract the specified range to this range instance

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IsValid Property

Gets a value indicating whether this range is valid. The range will be invalid if any of its cells don't belong to the owner data grid.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property IsValid As System.Boolean
```

C#

```
public System.bool IsValid {get;}
```

Property Value

`true` if this range is valid; otherwise, `false`.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

DataGridCellsRange Members

TopLeftCell Property
Gets the top left cell.

Syntax

Visual Basic (Declaration)
`Public ReadOnly Property TopLeftCell As DataGridCell`
C#
`public DataGridCell TopLeftCell {get;}`

Property Value

The top left cell.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Operators

Equality Operator

The obj.

The obj2.

Implements the operator ==.

Syntax

Visual Basic (Declaration)

```
Public Operator =( _
   ByVal obj As DataGridCellsRange, _
   ByVal obj2 As DataGridCellsRange _
) As System.Boolean
```

C#

```
public System.bool operator ==(
   DataGridCellsRange obj,
   DataGridCellsRange obj2
)
```

Parameters

obj

The obj.

obj2

The obj2.

Return Value

The result of the operator.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Inequality Operator
The obj.

The obj2.

Implements the operator !=.

Syntax

Visual Basic (Declaration)

```
Public Operator <>( _
   ByVal obj As DataGridCellsRange, _
   ByVal obj2 As DataGridCellsRange _
) As System.Boolean
```

C#

```
public System.bool operator !=(
   DataGridCellsRange obj,
   DataGridCellsRange obj2
)
```

Parameters

obj

The obj.

obj2

The obj2.

Return Value

The result of the operator.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Members

Properties Methods

The following tables list the members exposed by DataGridCellsRangeCollection.

Public Properties

	Name	Description

	Columns	Collection of columns that have some cell belonging to some of the contained ranges.
	Count	Gets the number of elements contained in the **System.Collections.Generic.ICollection`1**.
	IsReadOnly	Gets a value indicating whether the **System.Collections.Generic.ICollection`1** is read-only.
	Rows	Collection of rows that have some cell belonging to some of the contained ranges.

Top

Public Methods

	Name	Description
	Add	Adds the specified range.
	Clean	Removes all the invalid ranges.
	Clear	Removes all ranges from the **System.Collections.Generic.ICollection`1**.
	Contains	Overloaded. Determines whether this collection contains the specified range.
	CopyTo	Copies the elements of the **System.Collections.Generic.ICollection`1** to an **System.Array**, starting at a particular **System.Array** index.
	GetEnumerator	Returns an enumerator that iterates through the collection.
	Remove	Overloaded. Removes the specified range from the collection. If the specified range intersects some of the ranges in the collection, the range in the collection will be split.
	ToString	Returns a System.String that represents a set of cell ranges.

Reference

Add Method

The range.

Adds the specified range.

Syntax

Visual Basic (Declaration)

```
Public Sub Add( _
   ByVal range As DataGridCellsRange _
)
```

C#

```
public void Add(
   DataGridCellsRange range
)
```

Parameters

range

The range.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

DataGridCellsRangeCollection Members

Clean Method

Removes all the invalid ranges.

Syntax

Visual Basic (Declaration)

```
Public Sub Clean()
```

C#

```
public void Clean()
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

Clear Method

Removes all ranges from the **System.Collections.Generic.ICollection`1**.

Syntax

Visual Basic (Declaration)

```
Public Sub Clear()
```

C#

```
public void Clear()
```

Exceptions

Exception	Description
System.NotSupportedException	The **System.Collections.Generic.ICollection`1** is read-only.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Contains Method
Determines whether this collection contains the specified range.

Overload List

Overload	Description
Contains(DataGridCellsRange)	Determines whether this collection contains the specified range.
Contains(DataGridCellsRange,Boolean)	Determines whether this collection contains the specified range.
Contains(DataGridCell,Boolean)	Determines whether this collection contains the specified range.
Contains(DataGridRow,Boolean)	Determines whether this collection contains the specified range.
Contains(DataGridColumn,Boolean)	Determines whether this collection contains the specified range.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Contains(DataGridCellsRange) Method
The range.

Determines whether this collection contains the specified range.

Syntax

Visual Basic (Declaration)

```
Public Overloads Function Contains( _
   ByVal range As DataGridCellsRange _
) As System.Boolean
```

C#

```
public System.bool Contains(
   DataGridCellsRange range
)
```

Parameters

range

The range.

Return Value

`true` if this collection contains the specified range; otherwise, `false`.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Contains(DataGridCellsRange,Boolean) Method
The range.

if set to `true` return true only if the specified range is equal to some of the contained ranges.

Determines whether this collection contains the specified range.

Syntax

Visual Basic (Declaration)

```
Public Overloads Function Contains( _
```

```
   ByVal range As DataGridCellsRange, _
   ByVal isEqualToARange As System.Boolean _
) As System.Boolean
```

C#

```
public System.bool Contains(
   DataGridCellsRange range,
   System.bool isEqualToARange
)
```

Parameters

range

The range.

isEqualToARange

if set to `true` return true only if the specified range is equal to some of the contained ranges.

Return Value

`true` if this collection contains the specified range; otherwise, `false`.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Overload List

CopyTo Method

The one-dimensional **System.Array** that is the destination of the elements copied from **System.Collections.Generic.ICollection`1**. The **System.Array** must have zero-based indexing.

The zero-based index in array at which copying begins.

Copies the elements of the **System.Collections.Generic.ICollection`1** to an **System.Array**, starting at a particular **System.Array** index.

Syntax

Visual Basic (Declaration)

```
Public Sub CopyTo( _
   ByVal array() As DataGridCellsRange, _
   ByVal arrayIndex As System.Integer _
)
```

C#

```
public void CopyTo(
   DataGridCellsRange[] array,
   System.int arrayIndex
)
```

Parameters

array

The one-dimensional **System.Array** that is the destination of the elements copied from **System.Collections.Generic.ICollection`1**. The **System.Array** must have zero-based indexing.

arrayIndex

The zero-based index in array at which copying begins.

Exceptions

Exception	Description
System.ArgumentNullException	array is null.
System.ArgumentOutOfRangeException	arrayIndex is less than 0.
System.ArgumentException	array is multidimensional.-or-The number of

	elements in the source **System.Collections.Generic.ICollection`1** is greater than the available space from arrayIndex to the end of the destination array.-or-Type cannot be cast automatically to the type of the destination array.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GetEnumerator Method

Returns an enumerator that iterates through the collection.

Syntax

Visual Basic (Declaration)
`Public Function GetEnumerator() As System.Collections.Generic.IEnumerator(Of DataGridCellsRange)`
C#
`public System.Collections.Generic.IEnumerator<DataGridCellsRange> GetEnumerator()`

Return Value

A **System.Collections.Generic.IEnumerator`1** that can be used to iterate through the collection.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Remove Method
Removes the specified range from the collection. If the specified range intersects some of the ranges in the collection, the range in the collection will be split.

Overload List

Overload	Description
Remove(DataGridCellsRange)	Removes the specified range from the collection. If the specified range intersects some of the ranges in the collection, the range in the collection will be split.
Remove(DataGridRow)	Removes the specified row from the ranges in the collection.
Remove(DataGridColumn)	Removes the specified column from the in the collection.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Remove(DataGridCellsRange) Method
The range.

Removes the specified range from the collection. If the specified range intersects some of the ranges in the collection, the range in the collection will be split.

Syntax

Visual Basic (Declaration)

```
Public Overloads Function Remove( _
   ByVal range As DataGridCellsRange _
) As System.Boolean
```

C#

```
public System.bool Remove(
   DataGridCellsRange range
)
```

Parameters

range

The range.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Public Properties

	Name	Description
	ActualCanUserFilter	Gets a value indicating whether a user can perform a filter operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserGroup	Gets a value indicating whether a user can perform a group operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserResize	(Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserSort	Gets a value indicating whether a user can perform a sort operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualFilterMemberPath	Gets the actual FilterMemberPath. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)

	ActualGroupHeader	(Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualSortMemberPath	Gets the actual SortMemberPath. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	ActualWidth	Gets the actual width in pixels. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	AllowNull	Gets or sets a value indicating whether the editing control allows null values. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	Binding	Gets or sets the binding object used to bind the visual element against the data. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	CanUserFilter	Gets or sets a value indicating whether the user can filter by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserGroup	Gets or sets a value indicating whether the user can group by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserMove	Gets or sets a value that indicates whether the user can change the column display order by dragging column headers with the mouse. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserResize	Gets or sets whether the user can resize the column by dragging the border on the right of the column header presenter. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserResizeRows	Gets or sets whether the user can resize the rows manipulating cells in this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserSort	Gets or sets a value indicating whether the user can sort by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

	CellContentStyle	Gets or sets the style applied to the content of a cell in read mode. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CellEditingContentStyle	Gets or sets the style applied to the content of a cell in edit mode. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CellStyle	Gets or sets the style applied to every cell of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CheckedText	Gets or sets the text displayed in the auto-filter and the method GetCellText when the value of the cell is `true`.
	DataGrid	Gets the owner data grid. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	DefaultConverter	Overridden.
	Dispatcher	(Inherited from System.Windows.DependencyObject)
	DisplayIndex	Gets or sets the desired index in which the column will be displayed. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	EditOnSelection	Gets or sets a value indicating how the cells enters in edit mode when the user clicks on a cell of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Filter	Gets or sets the filter used in this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	FilterMemberPath	Gets or sets a property name, or a period-delimited hierarchy of property names, that indicates the member to filter by. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	FilterState	Gets the filter state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

	Format	Gets or sets the format of the content of the cells belonging this column. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	GroupContentConverter	Gets or sets the converter that will be applied to the visual element that is inside the content of each group row. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupContentStyle	Gets or sets the style applied to the title of each group row related to this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupConverter	Gets or sets the converter used to customize the grouping behavior. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupHeader	Gets or sets the header that will appear in the grouping panel as the column header is dragged there. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupState	Gets the grouping state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Header	Gets or sets the content of the header (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HeaderPresenter	Gets the presenter corresponding to the header of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HeaderStyle	Gets or sets the style of the header. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HorizontalAlignment	Gets or sets the horizontal alignment of the cell content regarding the cell. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HorizontalOffset	Gets the horizontal offset in pixels. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

	Index	Gets the index of a column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsAutoGenerated	Gets a value that indicates whether the column is auto-generated. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsEditable	(Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	IsFrozen	Gets a value indicating whether this column is moved out of the viewport when the user scrolls the data grid. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsMouseOver	Gets a value indicating whether the mouse is over the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsReadOnly	Gets or sets whether the cells in the column are read only. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsSelectable	Gets or sets a value indicating whether the user is allowed to set the current cell from this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsSelected	Gets a value indicating whether this column is selected. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	MaxWidth	Gets or sets the maximum width of the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	MinWidth	Gets or sets the minimum width of the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Name	Gets or sets the name of the column. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	SortMemberPath	Gets or sets a property name, or a period-delimited hierarchy of property names, that indicates the member to sort by. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

	SortState	Gets the sorting state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Tag	Gets or sets the tag. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	TextTrimming	Gets or sets a value indicating whether the text inside the cell allows trimming. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	TextWrapping	Gets or sets a value indicating whether the text inside the cell allows wrapping. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	UncheckedText	Gets or sets the text displayed in the auto-filter and the method GetCellText when the value of the cell is `false`.
	UndefinedText	Gets or sets the text displayed in the auto-filter and the method GetCellText when the value of the cell is `null`.
	VerticalAlignment	Gets or sets the vertical alignment of the cell content regarding the cell. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Visibility	Gets or sets whether the column is visible. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Width	Gets or sets the width of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

DataGridCheckBoxColumn Constructor

Overload List

Overload	Description
DataGridCheckBoxColumn Constructor()	Initializes a new instance of a DataGridCheckBoxColumn.
DataGridCheckBoxColumn Constructor(PropertyInfo)	Initializes a new instance of the DataGridCheckBoxColumn class.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

DataGridCheckBoxColumn Constructor(PropertyInfo)

The property info used to initialize the column.

Initializes a new instance of the DataGridCheckBoxColumn class.

Syntax

Visual Basic (Declaration)

`Public Function New( _`
`   ByVal property As System.Reflection.PropertyInfo _`
`)`

C#
`public DataGridCheckBoxColumn(` `   System.Reflection.PropertyInfo property`

)

Parameters

property

The property info used to initialize the column.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

BeginEdit Method

Syntax

Visual Basic (Declaration)

```
Public Overrides Function BeginEdit( _
   ByVal editingElement As System.Windows.FrameworkElement, _
   ByVal routedEventArgs As System.Windows.RoutedEventArgs _
) As System.Boolean
```

C#

```
public override System.bool BeginEdit(
   System.Windows.FrameworkElement editingElement,
   System.Windows.RoutedEventArgs routedEventArgs
)
```

Parameters

editingElement

routedEventArgs

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

BindCellContent Method

Syntax

Visual Basic (Declaration)

```
Public Overrides Sub BindCellContent( _
   ByVal cellContent As System.Windows.FrameworkElement, _
   ByVal row As DataGridRow _
)
```

C#

```
public override void BindCellContent(
   System.Windows.FrameworkElement cellContent,
   DataGridRow row
)
```

Parameters

cellContent

row

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CancelCellEdit Method

Syntax

Visual Basic (Declaration)

```
Public Overrides Sub CancelCellEdit( _
   ByVal editingElement As System.Windows.FrameworkElement, _
   ByVal uneditedValue As System.Object _
)
```

C#

```
public override void CancelCellEdit(
   System.Windows.FrameworkElement editingElement,
   System.object uneditedValue
)
```

Parameters

editingElement

uneditedValue

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CreateCellContent Method

Gets a CheckBox that will be used to display the info into a cell of this column.

Syntax

Visual Basic (Declaration)

```
Public Overrides Function CreateCellContent( _
   ByVal row As DataGridRow _
) As System.Windows.FrameworkElement
```

C#

```
public override System.Windows.FrameworkElement CreateCellContent(
   DataGridRow row
)
```

Parameters

row

Return Value

CheckBox that represent the cell content.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

EndEdit Method

Syntax

Visual Basic (Declaration)

```
Public Overrides Sub EndEdit( _
   ByVal editingElement As System.Windows.FrameworkElement _
)
```

C#

```
public override void EndEdit(
   System.Windows.FrameworkElement editingElement
```

```
)
```

Parameters

editingElement

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GetCellContentRecyclingKey Method

Syntax

Visual Basic (Declaration)

```
Public Overrides Function GetCellContentRecyclingKey( _
   ByVal row As DataGridRow _
) As System.Object
```

C#

```
public override System.object GetCellContentRecyclingKey(
   DataGridRow row
)
```

Parameters

row

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GetCellEditingContent Method

Gets a CheckBox that will be used to display the info into a cell of this column when the row is in edit mode.

Syntax

Visual Basic (Declaration)

```
Public Overrides Function GetCellEditingContent( _
   ByVal row As DataGridRow _
) As System.Windows.FrameworkElement
```

C#

```
public override System.Windows.FrameworkElement GetCellEditingContent(
   DataGridRow row
)
```

Parameters

row

Return Value

CheckBox that represent a cell content in edit mode.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

DataGridCheckBoxColumn Class
DataGridCheckBoxColumn Members

GetCellText Method

The row that contains the cell that is being queried.

Gets the text which represent the value shown inside a cell.

Syntax

Visual Basic (Declaration)

```
Public Overrides Function GetCellText( _
   ByVal row As DataGridRow _
) As System.String
```

C#

```
public override System.string GetCellText(
   DataGridRow row
)
```

Parameters

row

The row that contains the cell that is being queried.

Remarks

If the value is `true` the text shown will be value of the property CheckedText. If the value is `false` the text shown will be value of the property UncheckedText. If the value is `null` the text shown will be value of the property UndefinedText.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

PrepareCellForEdit Method

Syntax

Visual Basic (Declaration)

```
Public Overrides Function PrepareCellForEdit( _
   ByVal editingElement As System.Windows.FrameworkElement _
) As System.Object
```

C#

```
public override System.object PrepareCellForEdit(
   System.Windows.FrameworkElement editingElement
)
```

Parameters

editingElement

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

" -->

For a list of all members of this type, see DataGridCheckBoxColumn members.

Public Properties

	Name	Description
	ActualCanUserFilter	Gets a value indicating whether a user can perform a filter operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserGroup	Gets a value indicating whether a user can perform a group operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserResize	(Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserSort	Gets a value indicating whether a user can perform a sort operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualFilterMemberPath	Gets the actual FilterMemberPath. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	ActualGroupHeader	(Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualSortMemberPath	Gets the actual SortMemberPath. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	ActualWidth	Gets the actual width in pixels. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	AllowNull	Gets or sets a value indicating whether the editing control allows null values. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	Binding	Gets or sets the binding object used to bind the visual element against the data. (Inherited from

		C1.Silverlight.DataGrid.DataGridBoundColumn)
	CanUserFilter	Gets or sets a value indicating whether the user can filter by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserGroup	Gets or sets a value indicating whether the user can group by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserMove	Gets or sets a value that indicates whether the user can change the column display order by dragging column headers with the mouse. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserResize	Gets or sets whether the user can resize the column by dragging the border on the right of the column header presenter. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserResizeRows	Gets or sets whether the user can resize the rows manipulating cells in this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserSort	Gets or sets a value indicating whether the user can sort by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CellContentStyle	Gets or sets the style applied to the content of a cell in read mode. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CellEditingContentStyle	Gets or sets the style applied to the content of a cell in edit mode. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CellStyle	Gets or sets the style applied to every cell of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CheckedText	Gets or sets the text displayed in the auto-filter and the method GetCellText when the value of the cell is `true`.
	DataGrid	Gets the owner data grid. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

	DefaultConverter	Overridden.
	Dispatcher	(Inherited from System.Windows.DependencyObject)
	DisplayIndex	Gets or sets the desired index in which the column will be displayed. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	EditOnSelection	Gets or sets a value indicating how the cells enters in edit mode when the user clicks on a cell of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Filter	Gets or sets the filter used in this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	FilterMemberPath	Gets or sets a property name, or a period-delimited hierarchy of property names, that indicates the member to filter by. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	FilterState	Gets the filter state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Format	Gets or sets the format of the content of the cells belonging this column. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	GroupContentConverter	Gets or sets the converter that will be applied to the visual element that is inside the content of each group row. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupContentStyle	Gets or sets the style applied to the title of each group row related to this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupConverter	Gets or sets the converter used to customize the grouping behavior. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

	GroupHeader	Gets or sets the header that will appear in the grouping panel as the column header is dragged there. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupState	Gets the grouping state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Header	Gets or sets the content of the header (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HeaderPresenter	Gets the presenter corresponding to the header of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HeaderStyle	Gets or sets the style of the header. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HorizontalAlignment	Gets or sets the horizontal alignment of the cell content regarding the cell. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HorizontalOffset	Gets the horizontal offset in pixels. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Index	Gets the index of a column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsAutoGenerated	Gets a value that indicates whether the column is auto-generated. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsEditable	(Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	IsFrozen	Gets a value indicating whether this column is moved out of the viewport when the user scrolls the data grid. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsMouseOver	Gets a value indicating whether the mouse is over the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

	IsReadOnly	Gets or sets whether the cells in the column are read only. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsSelectable	Gets or sets a value indicating whether the user is allowed to set the current cell from this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsSelected	Gets a value indicating whether this column is selected. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	MaxWidth	Gets or sets the maximum width of the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	MinWidth	Gets or sets the minimum width of the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Name	Gets or sets the name of the column. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	SortMemberPath	Gets or sets a property name, or a period-delimited hierarchy of property names, that indicates the member to sort by. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	SortState	Gets the sorting state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Tag	Gets or sets the tag. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	TextTrimming	Gets or sets a value indicating whether the text inside the cell allows trimming. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	TextWrapping	Gets or sets a value indicating whether the text inside the cell allows wrapping. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)

	UncheckedText	Gets or sets the text displayed in the auto-filter and the method GetCellText when the value of the cell is `false`.
	UndefinedText	Gets or sets the text displayed in the auto-filter and the method GetCellText when the value of the cell is `null`.
	VerticalAlignment	Gets or sets the vertical alignment of the cell content regarding the cell. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Visibility	Gets or sets whether the column is visible. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Width	Gets or sets the width of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

CheckedText Property

Gets or sets the text displayed in the auto-filter and the method GetCellText when the value of the cell is `true`.

Syntax

Visual Basic (Declaration)

```
Public Property CheckedText As System.String
```

C#

```
public System.string CheckedText {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

UncheckedText Property

Gets or sets the text displayed in the auto-filter and the method GetCellText when the value of the cell is `false`.

Syntax

Visual Basic (Declaration)

```
Public Property UncheckedText As System.String
```

C#

```
public System.string UncheckedText {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Convert Method

The value produced by the binding source.

The type of the binding target property.

The converter parameter to use.

The culture to use in the converter.

Converts a value.

Syntax

Visual Basic (Declaration)	

```
Public Function Convert( _
   ByVal value As System.Object, _
   ByVal targetType As System.Type, _
```

```
   ByVal parameter As System.Object, _
   ByVal culture As System.Globalization.CultureInfo _
) As System.Object
```

C#

```
public System.object Convert(
   System.object value,
   System.Type targetType,
   System.object parameter,
   System.Globalization.CultureInfo culture
)
```

Parameters

value

The value produced by the binding source.

targetType

The type of the binding target property.

parameter

The converter parameter to use.

culture

The culture to use in the converter.

Return Value

A converted value. If the method returns null, the valid null value is used.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ConvertBack Method

The value that is produced by the binding target.

The type to convert to.

The converter parameter to use.

The culture to use in the converter.

Converts a value.

Syntax

Visual Basic (Declaration)

```
Public Function ConvertBack( _
   ByVal value As System.Object, _
   ByVal targetType As System.Type, _
   ByVal parameter As System.Object, _
   ByVal culture As System.Globalization.CultureInfo _
) As System.Object
```

C#

```
public System.object ConvertBack(
   System.object value,
   System.Type targetType,
   System.object parameter,
   System.Globalization.CultureInfo culture
)
```

Parameters

value

The value that is produced by the binding target.

targetType

The type to convert to.

parameter

The converter parameter to use.

culture

The culture to use in the converter.

Return Value

A converted value. If the method returns null, the valid null value is used.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Clear Method

Clears the current filter criteria and the values contained in the filter control.

Syntax

Visual Basic (Declaration)
`Public Sub Clear()`
C#
`public void Clear()`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Create Method

Creates the filter based on the current filter criteria set by the user in the filter control. Raises the FilterChanged event if necessary.

Syntax

Visual Basic (Declaration)
`Public Sub Create()`
C#
`public void Create()`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

DataGridCheckBoxFilter Class

Load Method

the desired state.

Initializes the filter and filter control to the desired state.

Syntax

Visual Basic (Declaration)

`Public Sub Load( _`
`   ByVal filterState As DataGridFilterState _`
`)`

C#

`public void Load(`
`   DataGridFilterState filterState`
`)`

Parameters

filterState

the desired state.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

OnApplyTemplate Method

Builds the visual tree for the DataGridCheckBoxFilter control when a new template is applied.

Syntax

Visual Basic (Declaration)
`Public Overrides Sub OnApplyTemplate()`
C#
`public override void OnApplyTemplate()`

Remarks

This method is invoked whenever application code or an internal process, such as a rebuilding layout pass, calls the **ApplyTemplate** method.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

FilterChanged Event

Occurs when the filter criteria changes.

Syntax

Visual Basic (Declaration)
`Public Event FilterChanged As System.EventHandler(Of PropertyChangedEventArgs(Of DataGridFilterState))`
C#
`public event System.EventHandler<PropertyChangedEventArgs<DataGridFilterState>> FilterChanged`

Event Data

The event handler receives an argument of type C1.Silverlight.PropertyChangedEventArgs<T> containing data related to this event. The following **PropertyChangedEventArgs<T>** properties provide information specific to this event.

Property	Description
NewValue	

OldValue	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Fields Properties Methods Events

The following tables list the members exposed by DataGridColumn.

Public Fields

	Name	Description
S	CanUserFilterProperty	Identifies the CanUserFilter dependency property.
S	CanUserGroupProperty	Identifies the CanUserGroup dependency property.
S	CanUserMoveProperty	Identifies the CanUserMove dependency property.
S	CanUserResizeProperty	Identifies the CanUserResize dependency property.
S	CanUserResizeRowsProperty	Identifies the CanUserResizeRows dependency property.
S	CanUserSortProperty	Identifies the CanUserSort dependency property.
S	CellContentStyleProperty	Identifies the CellContentStyle dependency property. Using a DependencyProperty as the backing store for CellContentStyle. This enables animation, styling, binding, etc...
S	CellEditingContentStyleProperty	Identifies the CellEditingContentStyle dependency property.
S	CellStyleProperty	Identifies the CellStyle dependency property.
S	EditOnSelectionProperty	Identifies the EditOnSelection dependency property.
S	FilterMemberPathProperty	Identifies the FilterMemberPath dependency property.
S	GroupContentStyleProperty	Identifies the GroupContentStyle dependency property.
S	GroupHeaderProperty	Identifies the GroupHeader dependency property.
S	HeaderProperty	Identifies the Header dependency property.
S	HeaderStyleProperty	Identifies the HeaderStyle dependency property.

S	HorizontalAlignmentProperty	Identifies the HorizontalAlignment dependency property.
S	IsReadOnlyProperty	Identifies the IsReadOnly dependency property.
S	IsSelectableProperty	Identifies the IsSelectable dependency property.
S	MaxWidthProperty	Identifies the MaxWidth dependency property.
S	MinWidthProperty	Identifies the MinWidth dependency property.
S	SortMemberPathProperty	Identifies the SortMemberPath dependency property.
S	TagProperty	Identifies the Tag dependency property.
S	VerticalAlignmentProperty	Identifies the VerticalAlignment dependency property.
S	VisibilityProperty	Identifies the Visibility dependency property.
S	WidthProperty	Identifies the Width dependency property.

Public Properties

	Name	Description
	ActualCanUserFilter	Gets a value indicating whether a user can perform a filter operation over this column.
	ActualCanUserGroup	Gets a value indicating whether a user can perform a group operation over this column.
	ActualCanUserResize	
	ActualCanUserSort	Gets a value indicating whether a user can perform a sort operation over this column.
	ActualFilterMemberPath	Gets the actual FilterMemberPath.

	ActualGroupHeader	
	ActualSortMemberPath	Gets the actual SortMemberPath.
	ActualWidth	Gets the actual width in pixels.
	CanUserFilter	Gets or sets a value indicating whether the user can filter by this column.
	CanUserGroup	Gets or sets a value indicating whether the user can group by this column.
	CanUserMove	Gets or sets a value that indicates whether the user can change the column display order by dragging column headers with the mouse.
	CanUserResize	Gets or sets whether the user can resize the column by dragging the border on the right of the column header presenter.
	CanUserResizeRows	Gets or sets whether the user can resize the rows manipulating cells in this column.
	CanUserSort	Gets or sets a value indicating whether the user can sort by this column.
	CellContentStyle	Gets or sets the style applied to the content of a cell in read mode.
	CellEditingContentStyle	Gets or sets the style applied to the content of a cell in edit mode.
	CellStyle	Gets or sets the style applied to every cell of this column.
	DataGrid	Gets the owner data grid.
	Dispatcher	(Inherited from System.Windows.DependencyObject)
	DisplayIndex	Gets or sets the desired index in which the column will be

		displayed.
	EditOnSelection	Gets or sets a value indicating how the cells enters in edit mode when the user clicks on a cell of this column.
	Filter	Gets or sets the filter used in this column.
	FilterMemberPath	Gets or sets a property name, or a period-delimited hierarchy of property names, that indicates the member to filter by.
	FilterState	Gets the filter state of this column.
	GroupContentConverter	Gets or sets the converter that will be applied to the visual element that is inside the content of each group row.
	GroupContentStyle	Gets or sets the style applied to the title of each group row related to this column.
	GroupConverter	Gets or sets the converter used to customize the grouping behavior.
	GroupHeader	Gets or sets the header that will appear in the grouping panel as the column header is dragged there.
	GroupState	Gets the grouping state of this column.
	Header	Gets or sets the content of the header
	HeaderPresenter	Gets the presenter corresponding to the header of this column.
	HeaderStyle	Gets or sets the style of the header.
	HorizontalAlignment	Gets or sets the horizontal alignment of the cell content regarding the cell.
	HorizontalOffset	Gets the horizontal offset in pixels.
	Index	Gets the index of a column.

	IsAutoGenerated	Gets a value that indicates whether the column is auto-generated.
	IsEditable	Gets a value indicating whether the cells in the column are editable or not.
	IsFrozen	Gets a value indicating whether this column is moved out of the viewport when the user scrolls the data grid.
	IsMouseOver	Gets a value indicating whether the mouse is over the column.
	IsReadOnly	Gets or sets whether the cells in the column are read only.
	IsSelectable	Gets or sets a value indicating whether the user is allowed to set the current cell from this column.
	IsSelected	Gets a value indicating whether this column is selected.
	MaxWidth	Gets or sets the maximum width of the column.
	MinWidth	Gets or sets the minimum width of the column.
	Name	Gets or sets the name of the column.
	SortMemberPath	Gets or sets a property name, or a period-delimited hierarchy of property names, that indicates the member to sort by.
	SortState	Gets the sorting state of this column.
	Tag	Gets or sets the tag.
	VerticalAlignment	Gets or sets the vertical alignment of the cell content regarding the cell.
	Visibility	Gets or sets whether the column is visible.
	Width	Gets or sets the width of this column.

Top

Public Methods

	Name	Description
	BeginEdit	Begins the edit passing the **System.Windows.RoutedEventArgs** that raised the edit of the cell.
	BindCellContent	Initializes the cell content presenter.
	CancelCellEdit	Causes the column cell being edited to revert to the specified value.
	ClearValue	(Inherited from System.Windows.DependencyObject)
	CreateCellContent	Creates the visual element that will be used to display the info inside a cell of this column.
	CreateGroupContent	Creates and initializes the **FrameworkElement** used to display in the group row related to this column.
	EndEdit	This method is called when the user finish the editing of the cell.
	GetAnimationBaseValue	(Inherited from System.Windows.DependencyObject)
	GetCellContentRecyclingKey	Key used to store the cell content for future reuse in a shared pool.
	GetCellEditingContent	Creates and initialize the visual element that will be used to edit the info of a cell belonging to this column when the cell is in edit mode.
	GetCellText	Gets the text shown inside a cell.
	GetCellValue	Gets the value represented by the cell belonging to this column and the specified row.

	GetColumnText	Gets the text shown in the column header.
	GetFilter	Gets the default filter of this column.
	GetGroupText	Gets the text shown in the group row.
	GetValue	(Inherited from System.Windows.DependencyObject)
	PrepareCellForEdit	When overridden in a derived class, called when a cell in the column enters edit mode.
	ReadLocalValue	(Inherited from System.Windows.DependencyObject)
	SetCellValue	Sets the value in the cell belonging to this column and the specified row.
	SetValue	(Inherited from System.Windows.DependencyObject)
	ToString	Returns a **System.String** that represents the current **System.Object**.
	UnbindCellContent	Unbinds the content of the cell.

Top

Public Events

	Name	Description
	FilterLoading	Occurs before the filter is loaded.
	FilterMemberPathChanged	Occurs when filter member path is changed.
	LoadingFilter	Occurs when the filter is loading.
	PropertyChanged	Occurs when a property value changes.
	SortMemberPathChanged	Occurs when sort member path is changed.

	VisibilityChanged	Occurs when the visibility changed.
	WidthChanged	Occurs when the column width is changed.

BeginEdit Method

The editing element.

The **System.Windows.RoutedEventArgs** instance containing the event data.

Begins the edit passing the **System.Windows.RoutedEventArgs** that raised the edit of the cell.

Syntax

Visual Basic (Declaration)

```
Public MustOverride Function BeginEdit( _
   ByVal editingElement As System.Windows.FrameworkElement, _
   ByVal routedEventArgs As System.Windows.RoutedEventArgs _
) As System.Boolean
```

C#

```
public abstract System.bool BeginEdit(
   System.Windows.FrameworkElement editingElement,
   System.Windows.RoutedEventArgs routedEventArgs
)
```

Parameters

editingElement

The editing element.

routedEventArgs

The **System.Windows.RoutedEventArgs** instance containing the event data.

Return Value

Returns true if the cell editing began correctly, otherwise the cell editing will be cancelled.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

EndEdit Method

BindCellContent Method

Example

Visual element that will be bound in order to display the cell content. If the cellContent received is not the expected you'll probably need to override the method GetCellContentRecyclingKey.

Row for which the cell will be initialized.

Initializes the cell content presenter.

Syntax

Visual Basic (Declaration)

```
Public Overridable Sub BindCellContent( _
   ByVal cellContent As System.Windows.FrameworkElement, _
   ByVal row As DataGridRow _
)
```

C#

```
public virtual void BindCellContent(
   System.Windows.FrameworkElement cellContent,
   DataGridRow row
)
```

Parameters

cellContent

Visual element that will be bound in order to display the cell content. If the cellContent received is not the expected you'll probably need to override the method GetCellContentRecyclingKey.

row

Row for which the cell will be initialized.

Remarks

This method must include cellContent property settings, SetBinding of the corresponding dependency property being "row.DataItem" the source which can be set directly in the binding or as DataContext of the cellContent.

This method is called after a cell content is created or a recycled one is taken.

Example

- C#

```
var txt = (TextBlock)cellContent;
            txt.HorizontalAlignment = HorizontalAlignment;
            txt.VerticalAlignment = VerticalAlignment;
            Binding newBinding = CopyBinding(Binding);
            newBinding.Source = row.DataItem;
            txt.SetBinding(TextBlock.TextProperty, newBinding);
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

UnbindCellContent

CancelCellEdit Method

The element that the column displays for a cell in editing mode.

The previous, unedited value in the cell being edited.

Causes the column cell being edited to revert to the specified value.

Syntax

Visual Basic (Declaration)

```
Public MustOverride Sub CancelCellEdit( _
   ByVal editingElement As System.Windows.FrameworkElement, _
   ByVal uneditedValue As System.Object _
)
```

C#

```
public abstract void CancelCellEdit(
   System.Windows.FrameworkElement editingElement,
   System.object uneditedValue
)
```

Parameters

editingElement

The element that the column displays for a cell in editing mode.

uneditedValue

The previous, unedited value in the cell being edited.

Remarks

The object passed in the uneditedValue parameter is taken from the method PrepareCellForEdit.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

EndEdit

CreateCellContent Method

This parameter might be used to have different cell content depending on the row. In most cases this parameter won't be used

Creates the visual element that will be used to display the info inside a cell of this column.

Syntax

Visual Basic (Declaration)

```
Public MustOverride Function CreateCellContent( _
   ByVal row As DataGridRow _
) As System.Windows.FrameworkElement
```

C#

```
public abstract System.Windows.FrameworkElement CreateCellContent(
   DataGridRow row
)
```

Parameters

row

This parameter might be used to have different cell content depending on the row. In most cases this parameter won't be used

Return Value

Visual element used to display the content of a cell.

Remarks

This method is only called if no cell content is found in the shared pool matching the recycling key returned by the method GetCellContentRecyclingKey.

Example

```
return new TextBlock();
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CreateGroupContent Method

Creates and initializes the **FrameworkElement** used to display in the group row related to this column.

Syntax

Visual Basic (Declaration)
`Public Overridable Function CreateGroupContent() As System.Windows.FrameworkElement`
C#
`public virtual System.Windows.FrameworkElement CreateGroupContent()`

Return Value

FrameworkElement used to display in the group row related to this column

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

EndEdit Method

The editing element.

This method is called when the user finish the editing of the cell.

Syntax

Visual Basic (Declaration)

```
Public MustOverride Sub EndEdit( _
   ByVal editingElement As System.Windows.FrameworkElement _
)
```

C#

```
public abstract void EndEdit(
   System.Windows.FrameworkElement editingElement
)
```

Parameters

editingElement

The editing element.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CancelCellEdit Method

GetCellContentRecyclingKey Method

This parameter can be used to have different cell content depending on the row. In most cases this parameter won't be used.

Key used to store the cell content for future reuse in a shared pool.

Syntax

Visual Basic (Declaration)

```
Public MustOverride Function GetCellContentRecyclingKey( _
   ByVal row As DataGridRow _
```

```
) As System.Object
```

C#

```
public abstract System.object GetCellContentRecyclingKey(
   DataGridRow row
)
```

Parameters

row

This parameter can be used to have different cell content depending on the row. In most cases this parameter won't be used.

Return Value

The recycling key, or null to disable recycling.

Remarks

Columns returning the same RecyclingKey will be candidate to share the same cells content instances.

Typically this method returns the type of the element returned by the method CreateCellContent.

Cell content lifecycle.

1. If there is no recycled cell content matching the recycling key, the method CreateCellContent will be called to create a new one.
2. Once the cell content is created or a recycled one is taken, the method BindCellContent will be called.
3. When the cell content is not being used the method UnbindCellContent will be called, and the cell content will be saved for future use in other cells.

Example

```
return typeof(TextBlock);
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GetCellEditingContent Method

The row corresponding to the editing cell.

Creates and initialize the visual element that will be used to edit the info of a cell belonging to this column when the cell is in edit mode.

Syntax

Visual Basic (Declaration)

```
Public MustOverride Function GetCellEditingContent( _
   ByVal row As DataGridRow _
) As System.Windows.FrameworkElement
```

C#

```
public abstract System.Windows.FrameworkElement GetCellEditingContent(
   DataGridRow row
)
```

Parameters

row

The row corresponding to the editing cell.

Return Value

Visual element used to edit the data of a cell when it is in edit mode.

Remarks

The returned element won't be recycled, once the editing is finished the visual element will be discarded. if you need to release resources you can do it in the method EndEdit.

It is no necessary to set the Source of the binding because the DataContext of the returned element will be set.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

EndEdit Method

GetCellText Method

The row.

Gets the text shown inside a cell.

Syntax

Visual Basic (Declaration)

```
Public Overridable Function GetCellText( _
   ByVal row As DataGridRow _
) As System.String
```

C#

```
public virtual System.string GetCellText(
   DataGridRow row
)
```

Parameters

row

The row.

Remarks

This feature is widely used in export operations like converting the data grid content to Excel or Pdf.

When the cell does not show a text like a DataGridCheckBoxColumn a representative text will be returned, e.g. "Yes", "No", "Undefined".

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GetCellValue Method

The row used to determine the cell.

Gets the value represented by the cell belonging to this column and the specified row.

Syntax

Visual Basic (Declaration)

```
Public Overridable Function GetCellValue( _
   ByVal Row As DataGridRow _
) As System.Object
```

C#

```
public virtual System.object GetCellValue(
   DataGridRow Row
)
```

Parameters

Row

The row used to determine the cell.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GetColumnText Method

Gets the text shown in the column header.

Syntax

Visual Basic (Declaration)

```
Public Overridable Function GetColumnText() As System.String
```

C#

```
public virtual System.string GetColumnText()
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GetFilter Method

Gets the default filter of this column.

Syntax

Visual Basic (Declaration)

```
Public Overridable Function GetFilter() As IDataGridFilter
```

C#

```
public virtual IDataGridFilter GetFilter()
```

Return Value

The filter related to this column.

Remarks

You can override the default filter by setting the property Filter, or listening to the events FilterLoading of this column and **C1DataGrid.FilterLoading**.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GetGroupText Method

The group row.

Gets the text shown in the group row.

Syntax

Visual Basic (Declaration)

```
Public Overridable Function GetGroupText( _
   ByVal groupRow As DataGridGroupRow _
) As System.String
```

C#

```
public virtual System.string GetGroupText(
   DataGridGroupRow groupRow
)
```

Parameters

groupRow

The group row.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

PrepareCellForEdit Method

The element that the column displays for a cell in editing mode.

When overridden in a derived class, called when a cell in the column enters edit mode.

Syntax

Visual Basic (Declaration)

```
Public MustOverride Function PrepareCellForEdit( _
   ByVal editingElement As System.Windows.FrameworkElement _
) As System.Object
```

C#

```
public abstract System.object PrepareCellForEdit(
   System.Windows.FrameworkElement editingElement
)
```

Parameters

editingElement

The element that the column displays for a cell in editing mode.

Return Value

The returned object will be passed in the CancelCellEdit method as a parameter in order to set the original value in the editing element when user cancel the edit.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

EndEdit

SetCellValue Method

The row used to determine the cell.

The value that will be set in the cell.

Sets the value in the cell belonging to this column and the specified row.

Syntax

Visual Basic (Declaration)

```
Public Overridable Sub SetCellValue( _
   ByVal Row As DataGridRow, _
   ByVal value As System.Object _
)
```

C#

```
public virtual void SetCellValue(
   DataGridRow Row,
   System.object value
)
```

Parameters

Row

The row used to determine the cell.

value

The value that will be set in the cell.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ToString Method

Returns a **System.String** that represents the current **System.Object**.

Syntax

Visual Basic (Declaration)

```
Public Overrides Function ToString() As System.String
```

C#

```
public override System.string ToString()
```

Return Value

A **System.String** that represents the current **System.Object**.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

UnbindCellContent Method

Visual element which is currently bound to the row.

The row currently bound to the cellContent.

Unbinds the content of the cell.

Syntax

Visual Basic (Declaration)

```
Public Overridable Sub UnbindCellContent( _
   ByVal cellContent As System.Windows.FrameworkElement, _
   ByVal row As DataGridRow _
```

)

C#

```
public virtual void UnbindCellContent(
   System.Windows.FrameworkElement cellContent,
   DataGridRow row
)
```

Parameters

cellContent

Visual element which is currently bound to the row.

row

The row currently bound to the cellContent.

Remarks

This method is called before the cell content is recycled. If you set the DataContext in the BindCellContent method, you must set it to null here to avoid memory leaking.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

For a list of all members of this type, see DataGridColumn members.

Public Properties

	Name	Description
	ActualCanUserFilter	Gets a value indicating whether a user can perform a filter operation over this column.
	ActualCanUserGroup	Gets a value indicating whether a user can perform a group operation over this column.
	ActualCanUserResize	
	ActualCanUserSort	Gets a value indicating whether a user can perform a sort operation over this column.
	ActualFilterMemberPath	Gets the actual FilterMemberPath.
	ActualGroupHeader	
	ActualSortMemberPath	Gets the actual SortMemberPath.
	ActualWidth	Gets the actual width in pixels.
	CanUserFilter	Gets or sets a value indicating whether the user can filter by this column.
	CanUserGroup	Gets or sets a value indicating whether the user can group by this column.
	CanUserMove	Gets or sets a value that indicates whether the user can change the column display order by dragging column headers with the mouse.
	CanUserResize	Gets or sets whether the user can resize the column by dragging the border on the right of the column header presenter.
	CanUserResizeRows	Gets or sets whether the user can resize the rows manipulating cells in this column.
	CanUserSort	Gets or sets a value indicating whether the user can sort by this

		column.
	CellContentStyle	Gets or sets the style applied to the content of a cell in read mode.
	CellEditingContentStyle	Gets or sets the style applied to the content of a cell in edit mode.
	CellStyle	Gets or sets the style applied to every cell of this column.
	DataGrid	Gets the owner data grid.
	Dispatcher	(Inherited from System.Windows.DependencyObject)
	DisplayIndex	Gets or sets the desired index in which the column will be displayed.
	EditOnSelection	Gets or sets a value indicating how the cells enters in edit mode when the user clicks on a cell of this column.
	Filter	Gets or sets the filter used in this column.
	FilterMemberPath	Gets or sets a property name, or a period-delimited hierarchy of property names, that indicates the member to filter by.
	FilterState	Gets the filter state of this column.
	GroupContentConverter	Gets or sets the converter that will be applied to the visual element that is inside the content of each group row.
	GroupContentStyle	Gets or sets the style applied to the title of each group row related to this column.
	GroupConverter	Gets or sets the converter used to customize the grouping behavior.
	GroupHeader	Gets or sets the header that will appear in the grouping panel as the column header is dragged there.

	GroupState	Gets the grouping state of this column.
	Header	Gets or sets the content of the header
	HeaderPresenter	Gets the presenter corresponding to the header of this column.
	HeaderStyle	Gets or sets the style of the header.
	HorizontalAlignment	Gets or sets the horizontal alignment of the cell content regarding the cell.
	HorizontalOffset	Gets the horizontal offset in pixels.
	Index	Gets the index of a column.
	IsAutoGenerated	Gets a value that indicates whether the column is auto-generated.
	IsEditable	Gets a value indicating whether the cells in the column are editable or not.
	IsFrozen	Gets a value indicating whether this column is moved out of the viewport when the user scrolls the data grid.
	IsMouseOver	Gets a value indicating whether the mouse is over the column.
	IsReadOnly	Gets or sets whether the cells in the column are read only.
	IsSelectable	Gets or sets a value indicating whether the user is allowed to set the current cell from this column.
	IsSelected	Gets a value indicating whether this column is selected.
	MaxWidth	Gets or sets the maximum width of the column.
	MinWidth	Gets or sets the minimum width of the column.
	Name	Gets or sets the name of the column.

	SortMemberPath	Gets or sets a property name, or a period-delimited hierarchy of property names, that indicates the member to sort by.
	SortState	Gets the sorting state of this column.
	Tag	Gets or sets the tag.
	VerticalAlignment	Gets or sets the vertical alignment of the cell content regarding the cell.
	Visibility	Gets or sets whether the column is visible.
	Width	Gets or sets the width of this column.

ActualCanUserFilter Property

Gets a value indicating whether a user can perform a filter operation over this column.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property ActualCanUserFilter As System.Boolean
```

C#

```
public System.bool ActualCanUserFilter {get;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ActualWidth Property
Gets the actual width in pixels.

Syntax

Visual Basic (Declaration)
`Public ReadOnly Property ActualWidth As System.Double`
C#
`public System.double ActualWidth {get;}`

Property Value

The actual width in pixels.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CanUserFilter Property
Gets or sets a value indicating whether the user can filter by this column.

Syntax

Visual Basic (Declaration)
`Public Property CanUserFilter As System.Boolean`
C#
`public System.bool CanUserFilter {get; set;}`

Property Value

`true` if the user can filter by this column; otherwise, `false`.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CanUserGroup Property

Gets or sets a value indicating whether the user can group by this column.

Syntax

Visual Basic (Declaration)
`Public Property CanUserGroup As System.Boolean`
C#
`public System.bool CanUserGroup {get; set;}`

Property Value

`true` if the user can group by this column; otherwise, `false`.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CanUserResizeRows Property
Gets or sets whether the user can resize the rows manipulating cells in this column.

Syntax

Visual Basic (Declaration)

```
Public Property CanUserResizeRows As System.Boolean
```

C#

```
public System.bool CanUserResizeRows {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CanUserSort Property
Gets or sets a value indicating whether the user can sort by this column.

Syntax

Visual Basic (Declaration)

```
Public Property CanUserSort As System.Boolean
```

C#

```
public System.bool CanUserSort {get; set;}
```

Property Value

`true` if the user can sort by this column; otherwise, `false`.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CellContentStyle Property

Gets or sets the style applied to the content of a cell in read mode.

Syntax

Visual Basic (Declaration)

```
Public Property CellContentStyle As System.Windows.Style
```

C#

```
public System.Windows.Style CellContentStyle {get; set;}
```

Remarks

The TargetType of this style must be the type of the object returned in CreateCellContent method.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CellEditingContentStyle Property

Gets or sets the style applied to the content of a cell in edit mode.

Syntax

Visual Basic (Declaration)
`Public Property CellEditingContentStyle As System.Windows.Style`
C#
`public System.Windows.Style CellEditingContentStyle {get; set;}`

Remarks

The TargetType of this style must be the type of the object returned in GetCellEditingContent method.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CellStyle Property

Gets or sets the style applied to every cell of this column.

Syntax

Visual Basic (Declaration)
`Public Property CellStyle As System.Windows.Style`
C#

```
public System.Windows.Style CellStyle {get; set;}
```

Remarks

The TargetType of the style must be DataGridCellPresenter.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

DataGrid Property
Gets the owner data grid.

Syntax

Visual Basic (Declaration)
`Public ReadOnly Property DataGrid As C1DataGrid`
C#
`public C1DataGrid DataGrid {get;}`

Property Value

The owner data grid.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

EditOnSelection Property

Gets or sets a value indicating how the cells enters in edit mode when the user clicks on a cell of this column.

Syntax

Visual Basic (Declaration)
`Public Property EditOnSelection As System.Boolean`
C#
`public System.bool EditOnSelection {get; set;}`

Remarks

If set to true, It enters in edit mode when the cell is selected, otherwise the user should click one time to select the cell, and click again to enter in edit mode.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

DataGridColumn Members

Filter Property

Gets or sets the filter used in this column.

Syntax

Visual Basic (Declaration)
`Public Property Filter As IDataGridFilter`
C#
`public IDataGridFilter Filter {get; set;}`

Property Value

The filter that will be displayed when the options drop-down in the column header is opened.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

FilterMemberPath Property

Gets or sets a property name, or a period-delimited hierarchy of property names, that indicates the member to filter by.

Syntax

Visual Basic (Declaration)

```
Public Property FilterMemberPath As System.String
```

C#

```
public System.string FilterMemberPath {get; set;}
```

Property Value

The path to the data-item member to filter by.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

FilterState Property
Gets the filter state of this column.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property FilterState As DataGridFilterState
```

C#

```
public DataGridFilterState FilterState {get;}
```

Remarks

Use **C1DataGrid.FilterBy** to change the filter criteria.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

GroupContentConverter Property

Gets or sets the converter that will be applied to the visual element that is inside the content of each group row.

Syntax

Visual Basic (Declaration)

```
Public Overridable Property GroupContentConverter As
System.Windows.Data.IValueConverter
```

C#

```
public virtual System.Windows.Data.IValueConverter GroupContentConverter
{get; set;}
```

Remarks

Typically this element is a **System.Windows.Controls.TextBlock** showing the grouping value.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

GroupContentStyle Property

Gets or sets the style applied to the title of each group row related to this column.

Syntax

Visual Basic (Declaration)

```
Public Property GroupContentStyle As System.Windows.Style
```

C#

```
public System.Windows.Style GroupContentStyle {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GroupConverter Property

Gets or sets the converter used to customize the grouping behavior.

Syntax

Visual Basic (Declaration)

```
Public Overridable Property GroupConverter As
System.Windows.Data.IValueConverter
```

C#

```
public virtual System.Windows.Data.IValueConverter GroupConverter {get; set;}
```

Remarks

The grouping algorithm will be applied to the resulting collection of applying this converter to each data item. This converter can be used to make things like outlook dates grouping, or group numeric values in ranges.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

GroupHeader Property

Gets or sets the header that will appear in the grouping panel as the column header is dragged there.

Syntax

Visual Basic (Declaration)

```
Public Property GroupHeader As System.Object
```

C#

```
public System.object GroupHeader {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

GroupState Property

Gets the grouping state of this column.

Syntax

Visual Basic (Declaration)

```
Public Property GroupState As DataGridGroupState
```

C#

```
public DataGridGroupState GroupState {get; set;}
```

Remarks

Use **C1DataGrid.GroupBy** to change the group criteria.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Header Property

Gets or sets the content of the header

Syntax

Visual Basic (Declaration)
`Public Property Header As System.Object`
C#
`public System.object Header {get; set;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

DataGridColumn Members

HeaderPresenter Property

Gets the presenter corresponding to the header of this column.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property HeaderPresenter As DataGridColumnHeaderPresenter
```

C#

```
public DataGridColumnHeaderPresenter HeaderPresenter {get;}
```

Property Value

The header presenter.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

DataGridColumn Members

HeaderStyle Property
Gets or sets the style of the header.

Syntax

Visual Basic (Declaration)

```
Public Property HeaderStyle As System.Windows.Style
```

C#

```
public System.Windows.Style HeaderStyle {get; set;}
```

Remarks

The TargetType of the style must be of the type **DataGridGroupColumnHeaderPresenter**.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

HorizontalAlignment Property

Gets or sets the horizontal alignment of the cell content regarding the cell.

Syntax

Visual Basic (Declaration)

```
Public Property HorizontalAlignment As System.Windows.HorizontalAlignment
```

C#

```
public System.Windows.HorizontalAlignment HorizontalAlignment {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

HorizontalOffset Property

Gets the horizontal offset in pixels.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property HorizontalOffset As System.Double
```

C#

```
public System.double HorizontalOffset {get;}
```

Property Value

The vertical offset in pixels.

Remarks

Notice this offset is estimated if the column or previous columns have not been displayed before. double.Nan is returned if the template of the C1DataGrid has not been loaded.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IsAutoGenerated Property

Gets a value that indicates whether the column is auto-generated.

Syntax

Visual Basic (Declaration)
`Public ReadOnly Property IsAutoGenerated As System.Boolean`
C#
`public System.bool IsAutoGenerated {get;}`

Property Value

`true` if the column is auto-generated; otherwise, `false`.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IsFrozen Property

Gets a value indicating whether this column is moved out of the viewport when the user scrolls the data grid.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property IsFrozen As System.Boolean
```

C#

```
public System.bool IsFrozen {get;}
```

Property Value

`true` if this column is frozen; otherwise, `false`.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IsMouseOver Property

Gets a value indicating whether the mouse is over the column.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property IsMouseOver As System.Boolean
```

C#

```
public System.bool IsMouseOver {get;}
```

Property Value

`true` if the mouse is over the column; otherwise, `false`.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IsReadOnly Property

Gets or sets whether the cells in the column are read only.

Syntax

Visual Basic (Declaration)

```
Public Property IsReadOnly As System.Boolean
```

C#

```
public System.bool IsReadOnly {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IsSelectable Property

Gets or sets a value indicating whether the user is allowed to set the current cell from this column.

Syntax

Visual Basic (Declaration)
`Public Property IsSelectable As System.Boolean`
C#
`public System.bool IsSelectable {get; set;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IsSelected Property
Gets a value indicating whether this column is selected.

Syntax

Visual Basic (Declaration)
`Public ReadOnly Property IsSelected As System.Boolean`
C#
`public System.bool IsSelected {get;}`

Property Value

`true` if this row is selected; otherwise, `false`.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

MaxWidth Property

Gets or sets the maximum width of the column.

Syntax

Visual Basic (Declaration)

```
Public Property MaxWidth As System.Double
```

C#

```
public System.double MaxWidth {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

MinWidth Property

Gets or sets the minimum width of the column.

Syntax

Visual Basic (Declaration)

```
Public Property MinWidth As System.Double
```

C#

```
public System.double MinWidth {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Name Property

Gets or sets the name of the column.

Syntax

Visual Basic (Declaration)
`Public Overridable Property Name As System.String`
C#
`public virtual System.string Name {get; set;}`

Property Value

The name of the column.

Remarks

This property can be used to access the column in the C1DataGrid columns collection.
`grid.Columns["Name of the column"]`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

DataGridColumn Class
DataGridColumn Members

SortMemberPath Property

Gets or sets a property name, or a period-delimited hierarchy of property names, that indicates the member to sort by.

Syntax

Visual Basic (Declaration)

```
Public Property SortMemberPath As System.String
```

C#

```
public System.string SortMemberPath {get; set;}
```

Property Value

The path to the data-item member to sort by.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

SortState Property

Gets the sorting state of this column.

Syntax

Visual Basic (Declaration)

```
Public Property SortState As DataGridSortState
```

C#

```
public DataGridSortState SortState {get; set;}
```

Remarks

Use **C1DataGrid.SortBy** to change the sort criteria.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

Tag Property

Gets or sets the tag.

Syntax

Visual Basic (Declaration)

```
Public Property Tag As System.Object
```

C#

```
public System.object Tag {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

VerticalAlignment Property

Gets or sets the vertical alignment of the cell content regarding the cell.

Syntax

Visual Basic (Declaration)

```
Public Property VerticalAlignment As System.Windows.VerticalAlignment
```

C#

```
public System.Windows.VerticalAlignment VerticalAlignment {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Visibility Property

Gets or sets whether the column is visible.

Syntax

Visual Basic (Declaration)

```
Public Property Visibility As System.Windows.Visibility
```

C#

```
public System.Windows.Visibility Visibility {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

DataGridColumn Class
DataGridColumn Members

Width Property

Gets or sets the width of this column.

Syntax

Visual Basic (Declaration)
`Public Property Width As DataGridLength`
C#
`public DataGridLength Width {get; set;}`

Remarks

DataGridLength supports four different modes

Type	Description
Pixel	The width of the column will be the same as the amount of pixels specified.
Auto	The width of the column will be determined by the content of the cells in the columns.
Star	The viewport space will be divided among the Star and AutoStar columns.
AutoStar	Each column is assured to have enough space to show its content and when extra space is available it is divided among the Star and AutoStar columns.

Notice MinWidth and MaxWidth has precedence over this property, that mean that if you set Width=100 and MinWidth=110 the actual value will be 110.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

FilterLoading Event

Occurs before the filter is loaded.

Syntax

Visual Basic (Declaration)
`Public Event FilterLoading As System.EventHandler(Of DataGridFilterLoadingEventArgs)`
C#
`public event System.EventHandler<DataGridFilterLoadingEventArgs> FilterLoading`

Event Data

The event handler receives an argument of type DataGridFilterLoadingEventArgs containing data related to this event. The following **DataGridFilterLoadingEventArgs** properties provide information specific to this event.

Property	Description
Filter	Gets or sets the filter that will be used for this column.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

FilterMemberPathChanged Event

Occurs when filter member path is changed.

Syntax

Visual Basic (Declaration)

```
Public Event FilterMemberPathChanged As System.EventHandler(Of
PropertyChangedEventArgs(Of String))
```

C#

```
public event System.EventHandler<PropertyChangedEventArgs<string>>
FilterMemberPathChanged
```

Event Data

The event handler receives an argument of type C1.Silverlight.PropertyChangedEventArgs<T> containing data related to this event. The following **PropertyChangedEventArgs<T>** properties provide information specific to this event.

Property	Description
NewValue	
OldValue	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Contains Method

Determines whether contains a column regarding the specified column name.

Overload List

Overload	Description
Contains(String)	Determines whether contains a column regarding the specified column name.
Contains(DataGridColumn)	(Inherited from System.Collections.ObjectModel.Collection<DataGridColumn>)

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

Contains(String) Method

Name of the column.

Determines whether contains a column regarding the specified column name.

Syntax

Visual Basic (Declaration)

```
Public Overloads Function Contains( _
   ByVal columnName As System.String _
) As System.Boolean
```

C#

```
public System.bool Contains(
   System.string columnName
)
```

Parameters

columnName

Name of the column.

Return Value

`true` if contains a column regarding the specified column name; otherwise, `false`.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GetPreviousVisibleColumn Method

Syntax

Visual Basic (Declaration)

```
Public Function GetPreviousVisibleColumn( _
   ByVal columnIndex As System.Integer _
) As DataGridColumn
```

C#

```
public DataGridColumn GetPreviousVisibleColumn(
   System.int columnIndex
)
```

Parameters

columnIndex

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GetVisibleColumnsFromIndex Method

Index of the first column.

The direction in which columns are returned.

Gets a collection of columns from a specified position and direction.

Syntax

Visual Basic (Declaration)

```
Public Function GetVisibleColumnsFromIndex( _
   ByVal fromColumnIndex As System.Integer, _
   ByVal direction As System.Windows.Controls.Primitives.GeneratorDirection _
) As System.Collections.Generic.IEnumerable(Of DataGridColumn)
```

C#

```
public System.Collections.Generic.IEnumerable<DataGridColumn>
GetVisibleColumnsFromIndex(
   System.int fromColumnIndex,
   System.Windows.Controls.Primitives.GeneratorDirection direction
)
```

Parameters

fromColumnIndex

Index of the first column.

direction

The direction in which columns are returned.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CollectionChanged Event

Occurs when the items list of the collection has changed, or the collection is reset.

Syntax

Visual Basic (Declaration)	
`Public Event CollectionChanged As`	

System.Collections.Specialized.NotifyCollectionChangedEventHandler	
C#	
public event System.Collections.Specialized.NotifyCollectionChangedEventHandler CollectionChanged	

Event Data

The event handler receives an argument of type System.Collections.Specialized.NotifyCollectionChangedEventArgs containing data related to this event. The following **NotifyCollectionChangedEventArgs** properties provide information specific to this event.

Property	Description
Action	Gets the description of the action that caused the event.
NewItems	Gets the items affected by an action.
NewStartingIndex	Gets the index at which the change occurred.
OldItems	Gets the item affected by a **System.Collections.Specialized.NotifyCollectionChangedAction.Replace** or **System.Collections.Specialized.NotifyCollectionChangedAction.Remove** action.
OldStartingIndex	Gets the index at which the change occurred for a **System.Collections.Specialized.NotifyCollectionChangedAction.Replace** or **System.Collections.Specialized.NotifyCollectionChangedAction.Remove** action.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

DataGridColumnHeaderPresenter Constructor

Initializes a new instance of a DataGridColumnHeaderPresenter.

Syntax

Visual Basic (Declaration)
`Public Function New()`
C#
`public DataGridColumnHeaderPresenter()`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Methods

>

Name	Description
AddHandler	(Inherited from System.Windows.UIElement)
ApplyTemplate	(Inherited from System.Windows.Controls.Control)
Arrange	(Inherited from System.Windows.UIElement)
CaptureMouse	(Inherited from System.Windows.UIElement)
ClearValue	(Inherited from System.Windows.DependencyObject)
FindName	(Inherited from System.Windows.FrameworkElement)
Focus	(Inherited from System.Windows.Controls.Control)
GetAnimationBaseValue	(Inherited from System.Windows.DependencyObject)
GetBindingExpression	(Inherited from System.Windows.FrameworkElement)
GetValue	(Inherited from System.Windows.DependencyObject)
InvalidateArrange	(Inherited from System.Windows.UIElement)
InvalidateMeasure	(Inherited from System.Windows.UIElement)
Measure	(Inherited from System.Windows.UIElement)
OnApplyTemplate	Overridden. Builds the visual tree for the DataGridColumnHeaderPresenter control when a new template is applied.
ReadLocalValue	(Inherited from System.Windows.DependencyObject)
ReleaseMouseCapture	(Inherited from System.Windows.UIElement)
RemoveHandler	(Inherited from System.Windows.UIElement)
SetBinding	(Inherited from System.Windows.FrameworkElement)
SetValue	(Inherited from System.Windows.DependencyObject)
TransformToVisual	(Inherited from System.Windows.UIElement)

UpdateLayout (Inherited from System.Windows.UIElement)

OnApplyTemplate Method

Builds the visual tree for the DataGridColumnHeaderPresenter control when a new template is applied.

Syntax

Visual Basic (Declaration)
`Public Overrides Sub OnApplyTemplate()`
C#
`public override void OnApplyTemplate()`

Remarks

This method is invoked whenever application code or an internal process, such as a rebuilding layout pass, calls the **ApplyTemplate** method.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Properties

>

Name	Description

ActualHeight	(Inherited from System.Windows.FrameworkElement)
ActualWidth	(Inherited from System.Windows.FrameworkElement)
AllowDrop	(Inherited from System.Windows.UIElement)
Background	(Inherited from System.Windows.Controls.Control)
BorderBrush	(Inherited from System.Windows.Controls.Control)
BorderThickness	(Inherited from System.Windows.Controls.Control)
CacheMode	(Inherited from System.Windows.UIElement)
CharacterSpacing	(Inherited from System.Windows.Controls.Control)
Clip	(Inherited from System.Windows.UIElement)
Column	Gets the column.
Content	(Inherited from System.Windows.Controls.ContentControl)
ContentTemplate	(Inherited from System.Windows.Controls.ContentControl)
Cursor	(Inherited from System.Windows.FrameworkElement)
DataContext	(Inherited from System.Windows.FrameworkElement)
DataGrid	Gets the owner data grid.
DesiredSize	(Inherited from System.Windows.UIElement)
Dispatcher	(Inherited from System.Windows.DependencyObject)
Effect	(Inherited from System.Windows.UIElement)
Filter	Gets or sets the filter used to filter the data in the column.
FlowDirection	(Inherited from System.Windows.FrameworkElement)
FontFamily	(Inherited from System.Windows.Controls.Control)
FontSize	(Inherited from System.Windows.Controls.Control)
FontStretch	(Inherited from System.Windows.Controls.Control)
FontStyle	(Inherited from System.Windows.Controls.Control)

FontWeight	(Inherited from System.Windows.Controls.Control)
Foreground	(Inherited from System.Windows.Controls.Control)
Height	(Inherited from System.Windows.FrameworkElement)
HorizontalAlignment	(Inherited from System.Windows.FrameworkElement)
HorizontalContentAlignment	(Inherited from System.Windows.Controls.Control)
IsEditing	Gets or sets a value indicating whether the column to which this header belongs is currently being edited.
IsEnabled	(Inherited from System.Windows.Controls.Control)
IsFiltering	Gets or sets a value indicating whether this column is currently filtering data or not.
IsHitTestVisible	(Inherited from System.Windows.UIElement)
IsInGroupingPanel	Gets or sets a value indicating whether the column header is in the grouping panel or not.
IsMerging	Gets or sets a value indicating whether the header may get merged.
IsMouseOver	Returns true if the mouse is over the control.
IsSelected	Gets or sets a value indicating whether the column to which this header belongs is currently selected or not.
IsTabStop	(Inherited from System.Windows.Controls.Control)
Language	(Inherited from System.Windows.FrameworkElement)
Margin	(Inherited from System.Windows.FrameworkElement)
MaxHeight	(Inherited from System.Windows.FrameworkElement)
MaxWidth	(Inherited from System.Windows.FrameworkElement)
MinHeight	(Inherited from System.Windows.FrameworkElement)
MinWidth	(Inherited from System.Windows.FrameworkElement)
MouseOverBrush	Gets or sets the **System.Windows.Media.Brush** used to highlight the control when it has the mouse over.

Name	(Inherited from System.Windows.FrameworkElement)
Opacity	(Inherited from System.Windows.UIElement)
OpacityMask	(Inherited from System.Windows.UIElement)
OptionsVisibility	Gets or sets a value indicating when the options drop-down will be visible.
Padding	(Inherited from System.Windows.Controls.Control)
Parent	(Inherited from System.Windows.FrameworkElement)
PressedBrush	Gets or sets the **System.Windows.Media.Brush** used to paint a button when it is pressed.
Projection	(Inherited from System.Windows.UIElement)
RemoveButtonVisibility	Gets or sets whether the remove button is visible or not
RenderSize	(Inherited from System.Windows.UIElement)
RenderTransform	(Inherited from System.Windows.UIElement)
RenderTransformOrigin	(Inherited from System.Windows.UIElement)
Resources	(Inherited from System.Windows.FrameworkElement)
SelectedBackground	Gets or sets the **System.Windows.Media.Brush** used to highlight the control when it is selected.
Style	(Inherited from System.Windows.FrameworkElement)
TabIndex	(Inherited from System.Windows.Controls.Control)
TabNavigation	(Inherited from System.Windows.Controls.Control)
Tag	(Inherited from System.Windows.FrameworkElement)
Template	(Inherited from System.Windows.Controls.Control)
Triggers	(Inherited from System.Windows.FrameworkElement)
UseLayoutRounding	(Inherited from System.Windows.UIElement)
VerticalAlignment	(Inherited from System.Windows.FrameworkElement)
VerticalContentAlignment	(Inherited from System.Windows.Controls.Control)

Visibility	(Inherited from System.Windows.UIElement)
Width	(Inherited from System.Windows.FrameworkElement)

Column Property

Gets the column.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property Column As DataGridColumn
```

C#

```
public DataGridColumn Column {get;}
```

Property Value

The column.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

DataGridColumnHeaderPresenter Class
DataGridColumnHeaderPresenter Members

DataGrid Property

Gets the owner data grid.

Syntax

Visual Basic (Declaration)
`Public ReadOnly Property DataGrid As C1DataGrid`
C#
`public C1DataGrid DataGrid {get;}`

Property Value

The owner data grid.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

Filter Property

Gets or sets the filter used to filter the data in the column.

Syntax

Visual Basic (Declaration)
`Public Property Filter As IDataGridFilter`
C#
`public IDataGridFilter Filter {get; set;}`

Property Value

The filter.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

IsEditing Property

Gets or sets a value indicating whether the column to which this header belongs is currently being edited.

Syntax

Visual Basic (Declaration)

```
Public Property IsEditing As System.Boolean
```

C#

```
public System.bool IsEditing {get; set;}
```

Remarks

If this property is set to true the visual state group "CommonStates" will change its visual state to "Editing".

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IsFiltering Property

Gets or sets a value indicating whether this column is currently filtering data or not.

Syntax

Visual Basic (Declaration)

```
Public Property IsFiltering As System.Boolean
```

C#

```
public System.bool IsFiltering {get; set;}
```

Remarks

If this property is set to true the visual state group "OptionsStates" will change its visual state to "Filtering".

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

IsInGroupingPanel Property

Gets or sets a value indicating whether the column header is in the grouping panel or not.

Syntax

Visual Basic (Declaration)

```
Public Property IsInGroupingPanel As System.Boolean
```

C#

```
public System.bool IsInGroupingPanel {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IsMerging Property

Gets or sets a value indicating whether the header may get merged.

Syntax

Visual Basic (Declaration)

```
Public Property IsMerging As System.Boolean
```

C#

```
public System.bool IsMerging {get; set;}
```

Remarks

If this property is set to true the visual state group "MergingStates" will change its visual state to "Merging".

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IsMouseOver Property

Returns true if the mouse is over the control.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property IsMouseOver As System.Boolean
```

C#

```
public System.bool IsMouseOver {get;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IsSelected Property

Gets or sets a value indicating whether the column to which this header belongs is currently selected or not.

Syntax

Visual Basic (Declaration)
`Public Property IsSelected As System.Boolean`
C#
`public System.bool IsSelected {get; set;}`

Remarks

If this property is set to true the visual state group "CommonStates" will change its visual state to "Selected".

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Events

%%scrap%%

" -->

For a list of all members of this type, see DataGridColumnHeaderPresenter members.

Public Events

	Name	Description
	AutoSized	Occurs when the column header is auto sized.
	BindingValidationError	(Inherited from System.Windows.FrameworkElement)
	DataContextChanged	(Inherited from System.Windows.FrameworkElement)
	DragEnter	(Inherited from System.Windows.UIElement)
	DragLeave	(Inherited from System.Windows.UIElement)
	DragOver	(Inherited from System.Windows.UIElement)
	Drop	(Inherited from System.Windows.UIElement)
	FilterChanged	Occurs when the state of the filter changed.
	FilterLoading	Occurs before the filter control of a column is opened.
	FilterOpened	Occurs when the filter control of a column is opened.

	GotFocus	(Inherited from System.Windows.UIElement)
	IsEnabledChanged	(Inherited from System.Windows.Controls.Control)
	IsMouseOverChanged	Event raised when the **IsMouseOver** property has changed.
	KeyDown	(Inherited from System.Windows.UIElement)
	KeyUp	(Inherited from System.Windows.UIElement)
	LayoutUpdated	(Inherited from System.Windows.FrameworkElement)
	Loaded	(Inherited from System.Windows.FrameworkElement)
	LostFocus	(Inherited from System.Windows.UIElement)
	LostMouseCapture	(Inherited from System.Windows.UIElement)
	MediaCommand	(Inherited from System.Windows.UIElement)
	MouseEnter	(Inherited from System.Windows.UIElement)
	MouseLeave	(Inherited from System.Windows.UIElement)
	MouseLeftButtonDown	(Inherited from System.Windows.UIElement)
	MouseLeftButtonUp	(Inherited from System.Windows.UIElement)
	MouseMove	(Inherited from System.Windows.UIElement)
	MouseRightButtonDown	(Inherited from System.Windows.UIElement)
	MouseRightButtonUp	(Inherited from System.Windows.UIElement)
	MouseWheel	(Inherited from System.Windows.UIElement)
	PropertyChanged	Occurs when a property value changes.

	Resized	Occurs when the column header is resized.
	Resizing	Occurs when the column header is resized.
	SizeChanged	(Inherited from System.Windows.FrameworkElement)
	TextInput	(Inherited from System.Windows.UIElement)
	TextInputStart	(Inherited from System.Windows.UIElement)
	TextInputUpdate	(Inherited from System.Windows.UIElement)
	Unloaded	(Inherited from System.Windows.FrameworkElement)

AutoSized Event

Occurs when the column header is auto sized.

Syntax

Visual Basic (Declaration)

```
Public Event AutoSized As System.EventHandler
```

C#

```
public event System.EventHandler AutoSized
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

FilterChanged Event

Occurs when the state of the filter changed.

Syntax

Visual Basic (Declaration)	
`Public Event FilterChanged As System.EventHandler(Of PropertyChangedEventArgs(Of DataGridFilterState))`	
C#	
`public event System.EventHandler<PropertyChangedEventArgs<DataGridFilterState>> FilterChanged`	

Event Data

The event handler receives an argument of type C1.Silverlight.PropertyChangedEventArgs<T> containing data related to this event. The following **PropertyChangedEventArgs<T>** properties provide information specific to this event.

Property	Description
NewValue	
OldValue	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

DataGridColumnHeaderPresenter Members

FilterLoading Event

Occurs before the filter control of a column is opened.

Syntax

Visual Basic (Declaration)
`Public Event FilterLoading As System.EventHandler(Of DataGridColumnEditableValueEventArgs(Of IDataGridFilter))`
C#
`public event System.EventHandler<DataGridColumnEditableValueEventArgs<IDataGridFilter>> FilterLoading`

Event Data

The event handler receives an argument of type DataGridColumnEditableValueEventArgs<T> containing data related to this event. The following **DataGridColumnEditableValueEventArgs<T>** properties provide information specific to this event.

Property	Description
Column	Gets the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumnEventArgs)
Value	Gets or sets the value associated with the column.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

DataGridColumnHeaderPresenter Members

FilterOpened Event

Occurs when the filter control of a column is opened.

Syntax

Visual Basic (Declaration)
`Public Event FilterOpened As System.EventHandler(Of DataGridColumnValueEventArgs(Of IDataGridFilter))`
C#
`public event System.EventHandler<DataGridColumnValueEventArgs<IDataGridFilter>> FilterOpened`

Event Data

The event handler receives an argument of type DataGridColumnValueEventArgs<T> containing data related to this event. The following **DataGridColumnValueEventArgs<T>** properties provide information specific to this event.

Property	Description
Column	Gets the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumnEventArgs)
Value	Gets the value associated with the column.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IsMouseOverChanged Event

Event raised when the **IsMouseOver** property has changed.

Syntax

Visual Basic (Declaration)	
`Public Event IsMouseOverChanged As System.EventHandler(Of PropertyChangedEventArgs(Of Boolean))`	
C#	
`public event System.EventHandler<PropertyChangedEventArgs<bool>> IsMouseOverChanged`	

Event Data

The event handler receives an argument of type C1.Silverlight.PropertyChangedEventArgs<T> containing data related to this event. The following **PropertyChangedEventArgs<T>** properties provide information specific to this event.

Property	Description
NewValue	
OldValue	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

PropertyChanged Event
Occurs when a property value changes.

Syntax

Visual Basic (Declaration)	
`Public Event PropertyChanged As System.ComponentModel.PropertyChangedEventHandler`	

C#

```
public event System.ComponentModel.PropertyChangedEventHandler
PropertyChanged
```

Event Data

The event handler receives an argument of type System.ComponentModel.PropertyChangedEventArgs containing data related to this event. The following **PropertyChangedEventArgs** properties provide information specific to this event.

Property	Description
PropertyName	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Resized Event

Occurs when the column header is resized.

Syntax

Visual Basic (Declaration)

```
Public Event Resized As System.EventHandler(Of PropertyChangedEventArgs(Of
Double))
```

C#

```
public event System.EventHandler<PropertyChangedEventArgs<double>> Resized
```

Event Data

The event handler receives an argument of type C1.Silverlight.PropertyChangedEventArgs<T> containing data related to this event. The following **PropertyChangedEventArgs<T>** properties provide information specific to this event.

Property	Description
NewValue	
OldValue	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Public Constructors

	Name	Description
	DataGridColumnHeaderRow Constructor	

Top

Public Properties

	Name	Description
	ActualCanUserToggleDetails	Gets or sets a value indicating whether the user can toggle details, taking in consideration properties of the containing DataGrid. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	ActualDetailsVisibility	Gets a value indicating whether this row is showing details, taking in consideration properties of the containing DataGrid. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	ActualHeight	Gets the actual height in pixels. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	ActualHeightWithoutDetails	Gets the actual height in pixels (without the details). (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	CanUserResize	Gets or sets a value indicating whether this row can be resized by the user. (Inherited from C1.Silverlight.DataGrid.DataGridRow)

	CanUserToggleDetails	Gets or sets a value indicating whether the user can toggle details. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	CellStyle	Gets or sets the style applied to all the cells of this row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	DataGrid	Gets the data grid to which the row belongs. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	DataItem	Gets the data of the row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	DetailsPresenter	Gets the visual element that will be arranged at the bottom of the row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	DetailsVisibility	Gets or sets a value indicating whether this row is showing details. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	Dispatcher	(Inherited from System.Windows.DependencyObject)
	Errors	Gets the collection of errors associated with this row. Add errors here if you want to display an error message in the corresponding row header. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	HeaderPresenter	Gets the visual element that represent the header of this row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	Height	Gets or sets the height of this row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	IndentWidth	Gets the distance between the row header and the first cell of the row. This empty space is only present when there are groups in the data grid. (Inherited from

		C1.Silverlight.DataGrid.DataGridRow)
	Index	Gets the index of the row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	IsEditable	Gets a value indicating whether this row is editable. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	IsEditing	Gets or sets a value indicating whether this row is editing. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	IsMouseOver	Gets a value indicating whether the mouse is over the row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	IsSelectable	Gets or sets a value indicating whether the user is allowed to set the current cell from this row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	IsSelected	Gets a value indicating whether this row is selected. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	Level	Gets the grouping level of this row. This info will be used to indent the row if the grid data is grouped. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	MaxHeight	Gets or sets the maximum height (in pixels) allowed. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	MinHeight	Gets or sets the minimum height (in pixels) allowed. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	ParentCollection	Gets the collection of rows to which this row belongs. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	ParentGroup	Gets the parent group. (Inherited from C1.Silverlight.DataGrid.DataGridRow)

	Presenter	Gets the visual element that represent this row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	RowHeaderStyle	Gets or sets the style applied to the row header presenter of this row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	RowStyle	Gets or sets the style of the row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	ShowVerticalFreezingSeparator	Gets a value indicating whether to show vertical freezing separator. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	Type	Gets the type of row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	ValidationResults	Gets the collection of errors associated with this row. Add errors here if you want to display an error message in the corresponding row header. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	VerticalOffset	Gets the vertical offset in pixels. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	Visibility	Gets or sets the visibility of the row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)

Top

Public Methods

	Name	Description
	ClearValue	(Inherited from System.Windows.DependencyObject)
	GetAnimationBaseValue	(Inherited from System.Windows.DependencyObject)

	GetCellPresenter	(Inherited from C1.Silverlight.DataGrid.DataGridRow)
	GetValue	(Inherited from System.Windows.DependencyObject)
	ReadLocalValue	(Inherited from System.Windows.DependencyObject)
	Refresh	Unload every visual element which is related to the row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	SetValue	(Inherited from System.Windows.DependencyObject)
	ToString	Returns a **System.String** that represents the current **System.Object**. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	Validate	Overloaded. Validates the DataGridRow.DataItem. Implement IDataErrorInfo or INotifyDataErrorInfo in order to implement your own validation rules. (Inherited from C1.Silverlight.DataGrid.DataGridRow)

Top

Public Events

	Name	Description
	CanUserResizeChanged	Occurs after the DataGridRow.CanUserResize value changed. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	CanUserToggleDetailsChanged	Occurs after the DataGridRow.CanUserToggleDetails value changed. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	DetailsVisibilityChanged	Occurs after the visibility of the details of the row changed. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	HeightChanged	Occurs after the height was changed. (Inherited from

		C1.Silverlight.DataGrid.DataGridRow)
	IsEditingChanged	Occurs when the IsEditing value changed. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	Loaded	Occurs after the row is added to the collection of rows. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	PropertyChanged	Occurs when a property value changes. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	VisibilityChanged	Occurs after the visibility of the row changed. (Inherited from C1.Silverlight.DataGrid.DataGridRow)

CanConvertFrom Method

Returns whether the type converter can convert an object from the specified type to the type of this converter.

Overload List

Overload	Description
CanConvertFrom(ITypeDescriptorContext,Type)	Returns whether the type converter can convert an object from the specified type to the type of this converter.
CanConvertFrom(Type)	(Inherited from System.ComponentModel.TypeConverter)

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

CanConvertFrom(ITypeDescriptorContext,Type) Method

An object that provides a format context.

The type you want to convert from.

Returns whether the type converter can convert an object from the specified type to the type of this converter.

Syntax

Visual Basic (Declaration)

```
Public Overloads Overrides Function CanConvertFrom( _
   ByVal context As System.ComponentModel.ITypeDescriptorContext, _
   ByVal sourceType As System.Type _
) As System.Boolean
```

C#

```
public override System.bool CanConvertFrom(
   System.ComponentModel.ITypeDescriptorContext context,
   System.Type sourceType
)
```

Parameters

context

An object that provides a format context.

sourceType

The type you want to convert from.

Return Value

true if this converter can perform the conversion; otherwise, false.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Overload List

ConvertFrom Method
Converts from the specified value to the intended conversion type of the converter.

Overload List

Overload	Description
ConvertFrom(ITypeDescriptorContext,CultureInfo,Object)	Converts from the specified value to the intended conversion type of the converter.
ConvertFrom(Object)	(Inherited from System.ComponentModel.TypeConverter)

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ConvertFrom(ITypeDescriptorContext,CultureInfo,Object) Method
An object that provides a format context.

The **System.Globalization.CultureInfo** to use as the current culture.

The value to convert to the type of this converter.

Converts from the specified value to the intended conversion type of the converter.

Syntax

Visual Basic (Declaration)

```
Public Overloads Overrides Function ConvertFrom( _
   ByVal context As System.ComponentModel.ITypeDescriptorContext, _
   ByVal culture As System.Globalization.CultureInfo, _
   ByVal value As System.Object _
) As System.Object
```

C#

```
public override System.object ConvertFrom(
   System.ComponentModel.ITypeDescriptorContext context,
   System.Globalization.CultureInfo culture,
   System.object value
)
```

Parameters

context

An object that provides a format context.

culture

The **System.Globalization.CultureInfo** to use as the current culture.

value

The value to convert to the type of this converter.

Return Value

The converted value.

Exceptions

Exception	Description
System.NotImplementedException	**System.ComponentModel.TypeConverter.ConvertFrom(S** not implemented in base **System.ComponentModel.TypeC**

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ClipBottomMargin Property

Gets or sets the clip bottom margin.

Syntax

Visual Basic (Declaration)

```
Public Property ClipBottomMargin As System.Double
```

C#

```
public System.double ClipBottomMargin {get; set;}
```

Property Value

The clip bottom margin.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

DataGridColumnValue<T> Constructor

The column.

The value.

Initializes a new instance of the DataGridColumnValue<T> class.

Syntax

Visual Basic (Declaration)

```
Public Function New( _
   ByVal column As DataGridColumn, _
   ByVal value As T _
)
```

C#

```
public DataGridColumnValue<T>(
   DataGridColumn column,
   T value
)
```

Parameters

column

The column.

value

The value.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

DataGridColumnValue<T> Class
C1.Silverlight.DataGrid Namespace

Equals Method

The **System.Object** to compare with this instance.

Determines whether the specified **System.Object**, is equal to this instance.

Syntax

Visual Basic (Declaration)

```
Public Overrides Function Equals( _
   ByVal obj As System.Object _
) As System.Boolean
```

C#

```
public override System.bool Equals(
   System.object obj
)
```

Parameters

obj

The **System.Object** to compare with this instance.

Return Value

`true` if the specified **System.Object** is equal to this instance; otherwise, `false`.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GetHashCode Method

Returns a hash code for this instance.

Syntax

Visual Basic (Declaration)
`Public Overrides Function GetHashCode() As System.Integer`
C#
`public override System.int GetHashCode()`

Return Value

A hash code for this instance, suitable for use in hashing algorithms and data structures like a hash table.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Top

Public Properties

	Name	Description
	ActualCanUserFilter	Gets a value indicating whether a user can perform a filter operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserGroup	Gets a value indicating whether a user can perform a group operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserResize	(Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserSort	Gets a value indicating whether a user can perform a sort operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

	ActualFilterMemberPath	Gets the actual FilterMemberPath. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	ActualGroupHeader	(Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualSortMemberPath	Gets the actual SortMemberPath. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	ActualWidth	Gets the actual width in pixels. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	AllowNull	Gets or sets a value indicating whether the editing control allows null values. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	Binding	Gets or sets the binding object used to bind the visual element against the data. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	CanUserFilter	Gets or sets a value indicating whether the user can filter by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserGroup	Gets or sets a value indicating whether the user can group by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserMove	Gets or sets a value that indicates whether the user can change the column display order by dragging column headers with the mouse. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserResize	Gets or sets whether the user can resize the column by dragging the border on the right of the column header presenter. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserResizeRows	Gets or sets whether the user can resize the rows manipulating cells in this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

	CanUserSort	Gets or sets a value indicating whether the user can sort by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CellContentStyle	Gets or sets the style applied to the content of a cell in read mode. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CellEditingContentStyle	Gets or sets the style applied to the content of a cell in edit mode. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CellStyle	Gets or sets the style applied to every cell of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	DataGrid	Gets the owner data grid. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	DefaultConverter	Overridden.
	Dispatcher	(Inherited from System.Windows.DependencyObject)
	DisplayIndex	Gets or sets the desired index in which the column will be displayed. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	DisplayMemberPath	Gets or sets the name or path of the property that is displayed for each item of the combo.
	DropDownHeight	Gets or sets the height of the dropdown (set to Double.NaN to size automatically).
	DropDownWidth	Gets or sets the width of the drop-down box (set to Double.NaN to size automatically).
	EditOnSelection	Gets or sets a value indicating how the cells enters in edit mode when the user clicks on a cell of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Filter	Gets or sets the filter used in this column. (Inherited from

		C1.Silverlight.DataGrid.DataGridColumn)
	FilterMemberPath	Gets or sets a property name, or a period-delimited hierarchy of property names, that indicates the member to filter by. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	FilterState	Gets the filter state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Format	Gets or sets the format of the content of the cells belonging this column. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	GroupContentConverter	Gets or sets the converter that will be applied to the visual element that is inside the content of each group row. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupContentStyle	Gets or sets the style applied to the title of each group row related to this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupConverter	Gets or sets the converter used to customize the grouping behavior. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupHeader	Gets or sets the header that will appear in the grouping panel as the column header is dragged there. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupState	Gets the grouping state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Header	Gets or sets the content of the header (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HeaderPresenter	Gets the presenter corresponding to the header of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

	HeaderStyle	Gets or sets the style of the header. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HorizontalAlignment	Gets or sets the horizontal alignment of the cell content regarding the cell. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HorizontalOffset	Gets the horizontal offset in pixels. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Index	Gets the index of a column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsAutoGenerated	Gets a value that indicates whether the column is auto-generated. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsEditable	(Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	IsFrozen	Gets a value indicating whether this column is moved out of the viewport when the user scrolls the data grid. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsMouseOver	Gets a value indicating whether the mouse is over the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsReadOnly	Gets or sets whether the cells in the column are read only. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsSelectable	Gets or sets a value indicating whether the user is allowed to set the current cell from this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsSelected	Gets a value indicating whether this column is selected. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ItemConverter	Item converter used to convert the items to string and vice versa.

	ItemNotFoundText	Gets or sets the text displayed when the corresponding item is not found.
	ItemsSource	Gets or sets the collection of items that will be displayed in the editing combo as well as in the filter.
	ItemTemplate	Gets or sets the item template shown in the items of the combo box.
	MaxDropDownHeight	Gets or sets maximum height constraint of the drop-down box.
	MaxDropDownWidth	Gets or sets maximum width constraint of the drop-down box.
	MaxWidth	Gets or sets the maximum width of the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	MinWidth	Gets or sets the minimum width of the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Name	Gets or sets the name of the column. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	SelectedValuePath	Gets or sets the path that is used to get the SelectedValue from the SelectedItem of the combo.
	SortMemberPath	Gets or sets a property name, or a period-delimited hierarchy of property names, that indicates the member to sort by. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	SortState	Gets the sorting state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Tag	Gets or sets the tag. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	TextTrimming	Gets or sets a value indicating whether the text inside the cell allows trimming. (Inherited from

		C1.Silverlight.DataGrid.DataGridBoundColumn)
	TextWrapping	Gets or sets a value indicating whether the text inside the cell allows wrapping. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	VerticalAlignment	Gets or sets the vertical alignment of the cell content regarding the cell. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Visibility	Gets or sets whether the column is visible. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Width	Gets or sets the width of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

	EndEdit	Overridden.

	GetActualCulture	Gets the culture in which the text and numbers of this columns will be shown. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	GetActualFormat	Gets the format that will be applied in the column considering different sources like Format property or StringFormat of the Binding property. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	GetAnimationBaseValue	(Inherited from System.Windows.DependencyObject)
	GetCellContentRecyclingKey	(Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	GetCellEditingContent	Overridden.
	GetCellText	Gets the text shown inside a cell. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GetCellValue	(Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	GetColumnText	Gets the text shown in the column header. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GetFilter	Overridden.
	GetGroupText	(Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	GetValue	(Inherited from System.Windows.DependencyObject)
	PrepareCellForEdit	Overridden.
	ReadLocalValue	(Inherited from System.Windows.DependencyObject)
	SetCellValue	(Inherited from

		C1.Silverlight.DataGrid.DataGridBoundColumn)
	SetValue	(Inherited from System.Windows.DependencyObject)
	ToString	Returns a **System.String** that represents the current **System.Object**. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	UnbindCellContent	(Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)

DataGridComboBoxColumn Constructor

Overload List

Overload	Description
DataGridComboBoxColumn Constructor()	Initializes a new instance of a DataGridComboBoxColumn.
DataGridComboBoxColumn Constructor(PropertyInfo)	Initializes a new instance of the DataGridComboBoxColumn class.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

DataGridComboBoxColumn Members
Overload List

DataGridComboBoxColumn Constructor(PropertyInfo)

The property info used to initialize the column.

Initializes a new instance of the DataGridComboBoxColumn class.

Syntax

Visual Basic (Declaration)

```
Public Function New( _
   ByVal property As System.Reflection.PropertyInfo _
)
```

C#

```
public DataGridComboBoxColumn(
   System.Reflection.PropertyInfo property
)
```

Parameters

property

The property info used to initialize the column.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Public Methods

	Name	Description
	BeginEdit	Overridden.
	BindCellContent	(Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	CancelCellEdit	Overridden.
	ClearValue	(Inherited from System.Windows.DependencyObject)
	CreateCellContent	Gets a TextBlock that will be used to display the info inside a cell of this column. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	CreateGroupContent	(Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	EndEdit	Overridden.
	GetActualCulture	Gets the culture in which the text and numbers of this columns will be shown. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	GetActualFormat	Gets the format that will be applied in the column considering different sources like Format property or StringFormat of the Binding property. (Inherited from

		C1.Silverlight.DataGrid.DataGridBoundColumn)
	GetAnimationBaseValue	(Inherited from System.Windows.DependencyObject)
	GetCellContentRecyclingKey	(Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	GetCellEditingContent	Overridden.
	GetCellText	Gets the text shown inside a cell. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GetCellValue	(Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	GetColumnText	Gets the text shown in the column header. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GetFilter	Overridden.
	GetGroupText	(Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	GetValue	(Inherited from System.Windows.DependencyObject)
	PrepareCellForEdit	Overridden.
	ReadLocalValue	(Inherited from System.Windows.DependencyObject)
	SetCellValue	(Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	SetValue	(Inherited from System.Windows.DependencyObject)
	ToString	Returns a **System.String** that represents the current **System.Object**. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

	UnbindCellContent	(Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)

For a list of all members of this type, see DataGridComboBoxColumn members.

Public Properties

	Name	Description
	ActualCanUserFilter	Gets a value indicating whether a user can perform a filter operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserGroup	Gets a value indicating whether a user can perform a group operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserResize	(Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserSort	Gets a value indicating whether a user can perform a sort operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualFilterMemberPath	Gets the actual FilterMemberPath. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)

	ActualGroupHeader	(Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualSortMemberPath	Gets the actual SortMemberPath. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	ActualWidth	Gets the actual width in pixels. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	AllowNull	Gets or sets a value indicating whether the editing control allows null values. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	Binding	Gets or sets the binding object used to bind the visual element against the data. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	CanUserFilter	Gets or sets a value indicating whether the user can filter by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserGroup	Gets or sets a value indicating whether the user can group by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserMove	Gets or sets a value that indicates whether the user can change the column display order by dragging column headers with the mouse. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserResize	Gets or sets whether the user can resize the column by dragging the border on the right of the column header presenter. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserResizeRows	Gets or sets whether the user can resize the rows manipulating cells in this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserSort	Gets or sets a value indicating whether the user can sort by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

	CellContentStyle	Gets or sets the style applied to the content of a cell in read mode. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CellEditingContentStyle	Gets or sets the style applied to the content of a cell in edit mode. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CellStyle	Gets or sets the style applied to every cell of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	DataGrid	Gets the owner data grid. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	DefaultConverter	Overridden.
	Dispatcher	(Inherited from System.Windows.DependencyObject)
	DisplayIndex	Gets or sets the desired index in which the column will be displayed. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	DisplayMemberPath	Gets or sets the name or path of the property that is displayed for each item of the combo.
	DropDownHeight	Gets or sets the height of the dropdown (set to Double.NaN to size automatically).
	DropDownWidth	Gets or sets the width of the drop-down box (set to Double.NaN to size automatically).
	EditOnSelection	Gets or sets a value indicating how the cells enters in edit mode when the user clicks on a cell of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Filter	Gets or sets the filter used in this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	FilterMemberPath	Gets or sets a property name, or a period-delimited hierarchy of property names, that indicates the member to filter by. (Inherited

		from C1.Silverlight.DataGrid.DataGridColumn)
	FilterState	Gets the filter state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Format	Gets or sets the format of the content of the cells belonging this column. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	GroupContentConverter	Gets or sets the converter that will be applied to the visual element that is inside the content of each group row. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupContentStyle	Gets or sets the style applied to the title of each group row related to this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupConverter	Gets or sets the converter used to customize the grouping behavior. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupHeader	Gets or sets the header that will appear in the grouping panel as the column header is dragged there. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupState	Gets the grouping state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Header	Gets or sets the content of the header (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HeaderPresenter	Gets the presenter corresponding to the header of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HeaderStyle	Gets or sets the style of the header. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HorizontalAlignment	Gets or sets the horizontal alignment of the cell content regarding the cell. (Inherited from

		C1.Silverlight.DataGrid.DataGridColumn)
	HorizontalOffset	Gets the horizontal offset in pixels. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Index	Gets the index of a column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsAutoGenerated	Gets a value that indicates whether the column is auto-generated. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsEditable	(Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	IsFrozen	Gets a value indicating whether this column is moved out of the viewport when the user scrolls the data grid. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsMouseOver	Gets a value indicating whether the mouse is over the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsReadOnly	Gets or sets whether the cells in the column are read only. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsSelectable	Gets or sets a value indicating whether the user is allowed to set the current cell from this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsSelected	Gets a value indicating whether this column is selected. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ItemConverter	Item converter used to convert the items to string and vice versa.
	ItemNotFoundText	Gets or sets the text displayed when the corresponding item is not found.
	ItemsSource	Gets or sets the collection of items that will be displayed in the

		editing combo as well as in the filter.
	ItemTemplate	Gets or sets the item template shown in the items of the combo box.
	MaxDropDownHeight	Gets or sets maximum height constraint of the drop-down box.
	MaxDropDownWidth	Gets or sets maximum width constraint of the drop-down box.
	MaxWidth	Gets or sets the maximum width of the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	MinWidth	Gets or sets the minimum width of the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Name	Gets or sets the name of the column. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	SelectedValuePath	Gets or sets the path that is used to get the SelectedValue from the SelectedItem of the combo.
	SortMemberPath	Gets or sets a property name, or a period-delimited hierarchy of property names, that indicates the member to sort by. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	SortState	Gets the sorting state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Tag	Gets or sets the tag. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	TextTrimming	Gets or sets a value indicating whether the text inside the cell allows trimming. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	TextWrapping	Gets or sets a value indicating whether the text inside the cell allows wrapping. (Inherited from

		C1.Silverlight.DataGrid.DataGridBoundColumn)
	VerticalAlignment	Gets or sets the vertical alignment of the cell content regarding the cell. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Visibility	Gets or sets whether the column is visible. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Width	Gets or sets the width of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

DefaultConverter Property

Syntax

Visual Basic (Declaration)

```
Public Overrides ReadOnly Property DefaultConverter As
System.Windows.Data.IValueConverter
```

C#

```
public override System.Windows.Data.IValueConverter DefaultConverter {get;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

DataGridComboBoxColumn Members

DisplayMemberPath Property

Gets or sets the name or path of the property that is displayed for each item of the combo.

Syntax

Visual Basic (Declaration)

```
Public Property DisplayMemberPath As System.String
```

C#

```
public System.string DisplayMemberPath {get; set;}
```

Property Value

The name or path of the property that is displayed for each the item of the combo. The default is an empty string ("")..

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

DropDownHeight Property

Gets or sets the height of the dropdown (set to Double.NaN to size automatically).

Syntax

Visual Basic (Declaration)

```
Public Property DropDownHeight As System.Double
```

C#

```
public System.double DropDownHeight {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

DropDownWidth Property

Gets or sets the width of the drop-down box (set to Double.NaN to size automatically).

Syntax

Visual Basic (Declaration)

```
Public Property DropDownWidth As System.Double
```

C#

```
public System.double DropDownWidth {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ItemConverter Property

Item converter used to convert the items to string and vice versa.

Syntax

Visual Basic (Declaration)

```
Public Property ItemConverter As System.ComponentModel.TypeConverter
```

C#

```
public System.ComponentModel.TypeConverter ItemConverter {get; set;}
```

Remarks

Use in conjunction with ItemTemplate to support AutoComplete and editing when providing custom item visualization.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

ItemNotFoundText Property

Gets or sets the text displayed when the corresponding item is not found.

Syntax

Visual Basic (Declaration)

```
Public Property ItemNotFoundText As System.String
```

C#

```
public System.string ItemNotFoundText {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ItemsSource Property

Gets or sets the collection of items that will be displayed in the editing combo as well as in the filter.

Syntax

Visual Basic (Declaration)
`Public Property ItemsSource As System.Collections.IEnumerable`
C#
`public System.Collections.IEnumerable ItemsSource {get; set;}`

Remarks

Use this property in conjunction with DisplayMemberPath and SelectedValuePath to indicate which property value will be displayed and which property value will be set in the data item when an item of the combo box is chosen.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

ItemTemplate Property

Gets or sets the item template shown in the items of the combo box.

Syntax

Visual Basic (Declaration)
`Public Property ItemTemplate As System.Windows.DataTemplate`
C#
`public System.Windows.DataTemplate ItemTemplate {get; set;}`

Property Value

The item template.

Remarks

If this property is set the property DisplayMemberPath will not be set in the editing combo.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

SelectedValuePath Property
Gets or sets the path that is used to get the SelectedValue from the SelectedItem of the combo.

Syntax

Visual Basic (Declaration)
`Public Property SelectedValuePath As System.String`
C#
`public System.string SelectedValuePath {get; set;}`

Property Value

Returns the path used to get the SelectedValue. The default is an empty string.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

DataGridComboBoxFilter Constructor

Initializes a new instance of a DataGridComboBoxFilter.

Syntax

Visual Basic (Declaration)
`Public Function New()`
C#
`public DataGridComboBoxFilter()`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Clear Method

Clears the current filter criteria and the values contained in the filter control.

Syntax

Visual Basic (Declaration)

```
Public Sub Clear()
```

C#

```
public void Clear()
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

Create Method

Creates the filter based on the current filter criteria set by the user in the filter control. Raises the FilterChanged event if necessary.

Syntax

Visual Basic (Declaration)

```
Public Sub Create()
```

C#

```
public void Create()
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

DataGridComboBoxFilter Class
DataGridComboBoxFilter Members

Load Method

the desired state.

Initializes the filter and filter control to the desired state.

Syntax

Visual Basic (Declaration)

```
Public Sub Load( _
   ByVal filterState As DataGridFilterState _
)
```

C#

```
public void Load(
   DataGridFilterState filterState
)
```

Parameters

filterState

the desired state.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

OnApplyTemplate Method

Builds the visual tree for the DataGridComboBoxFilter control when a new template is applied.

Syntax

Visual Basic (Declaration)
`Public Overrides Sub OnApplyTemplate()`
C#
`public override void OnApplyTemplate()`

Remarks

This method is invoked whenever application code or an internal process, such as a rebuilding layout pass, calls the **ApplyTemplate** method.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

FocusBrush Property

Gets or sets the **System.Windows.Media.Brush** used to highlight the focused control.

Syntax

Visual Basic (Declaration)

```
Public Property FocusBrush As System.Windows.Media.Brush
```

C#

```
public System.Windows.Media.Brush FocusBrush {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Values Property

Gets or sets the values displayed in the filter.

Syntax

Visual Basic (Declaration)
`Public Property Values As System.Collections.Generic.IEnumerable(Of ComboValueInfo)`
C#
`public System.Collections.Generic.IEnumerable<ComboValueInfo> Values {get; set;}`

Property Value

The values displayed in the filter.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

DataGridDateFilter

The filter for date values. This control should be used as InnerControl for the DataGridFilter control to create the date filter for the C1DataGrid. Represents the default filter control for date columns.

Object Model

Syntax

Visual Basic (Declaration)

```
Public Class DataGridDateFilter
   Inherits System.Windows.Controls.Control
   Implements IDataGridFilter
```

C#

```
public class DataGridDateFilter : System.Windows.Controls.Control,
IDataGridFilter
```

Members

Fields Properties Methods Events

The following tables list the members exposed by DataGridDateFilter.

Public Constructors

	Name	Description
	DataGridDateFilter Constructor	Initializes a new instance of a DataGridDateFilter.

Top

Public Fields

	Name	Description
S	FocusBrushProperty	Identifies the FocusBrush dependency property.
S	InputBackgroundProperty	Identifies the InputBackground dependency property.
S	InputForegroundProperty	Identifies the InputForeground dependency property.
S	MouseOverBrushProperty	Identifies the MouseOverBrush dependency property.
S	PressedBrushProperty	Identifies the PressedBrush dependency property.
S	SelectedBackgroundProperty	Identifies the SelectedBackground dependency property.

Clear Method

Clears the current filter criteria and the values contained in the filter control.

Syntax

Visual Basic (Declaration)
`Public Sub Clear()`
C#
`public void Clear()`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Create Method

Creates the filter based on the current filter criteria set by the user in the filter control. Raises the FilterChanged event if necessary.

Syntax

Visual Basic (Declaration)
`Public Sub Create()`
C#
`public void Create()`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Load Method

the desired state.

Initializes the filter and filter control to the desired state.

Syntax

Visual Basic (Declaration)

```
Public Sub Load( _
   ByVal filterState As DataGridFilterState _
)
```

C#

```
public void Load(
   DataGridFilterState filterState
)
```

Parameters

filterState

the desired state.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

OnApplyTemplate Method

Builds the visual tree for the DataGridDateFilter control when a new template is applied.

Syntax

Visual Basic (Declaration)

```
Public Overrides Sub OnApplyTemplate()
```

C#

```
public override void OnApplyTemplate()
```

Remarks

This method is invoked whenever application code or an internal process, such as a rebuilding layout pass, calls the **ApplyTemplate** method.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

FilterChanged Event

Occurs when the filter criteria changes.

Syntax

Visual Basic (Declaration)

```
Public Event FilterChanged As System.EventHandler(Of
PropertyChangedEventArgs(Of DataGridFilterState))
```

C#

```
public event
System.EventHandler<PropertyChangedEventArgs<DataGridFilterState>>
FilterChanged
```

Event Data

The event handler receives an argument of type C1.Silverlight.PropertyChangedEventArgs<T> containing data related to this event. The following **PropertyChangedEventArgs<T>** properties provide information specific to this event.

Property	Description
NewValue	
OldValue	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Public Properties

	Name	Description

	ActualCanUserFilter	Gets a value indicating whether a user can perform a filter operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserGroup	Gets a value indicating whether a user can perform a group operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserResize	(Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserSort	Gets a value indicating whether a user can perform a sort operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualFilterMemberPath	Gets the actual FilterMemberPath. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	ActualGroupHeader	(Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualSortMemberPath	Gets the actual SortMemberPath. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	ActualWidth	Gets the actual width in pixels. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	AllowNull	Gets or sets a value indicating whether the editing control allows null values. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	Binding	Gets or sets the binding object used to bind the visual element against the data. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	CanUserFilter	Gets or sets a value indicating whether the user can filter by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserGroup	Gets or sets a value indicating whether the user can group by this

		column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserMove	Gets or sets a value that indicates whether the user can change the column display order by dragging column headers with the mouse. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserResize	Gets or sets whether the user can resize the column by dragging the border on the right of the column header presenter. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserResizeRows	Gets or sets whether the user can resize the rows manipulating cells in this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserSort	Gets or sets a value indicating whether the user can sort by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CellContentStyle	Gets or sets the style applied to the content of a cell in read mode. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CellEditingContentStyle	Gets or sets the style applied to the content of a cell in edit mode. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CellStyle	Gets or sets the style applied to every cell of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CustomDateFormat	Gets or sets the format that will be applied to the date picker. This property only applied if EditMode is DataTime or Date.
	CustomTimeFormat	Gets or sets the format that will be applied to the time editor.
	DataGrid	Gets the owner data grid. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	DateFormat	Gets or sets the **System.Windows.Controls.DatePickerFormat** value determining DatePicker format.

	DefaultConverter	Overridden.
	Dispatcher	(Inherited from System.Windows.DependencyObject)
	DisplayIndex	Gets or sets the desired index in which the column will be displayed. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	EditMode	Gets or sets the DataGridDateTimeColumnEditMode value determining column representation. The default value is DataGridDateTimeColumnEditMode.DateTime.
	EditOnSelection	Gets or sets a value indicating how the cells enters in edit mode when the user clicks on a cell of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Filter	Gets or sets the filter used in this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	FilterMemberPath	Gets or sets a property name, or a period-delimited hierarchy of property names, that indicates the member to filter by. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	FilterState	Gets the filter state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	FirstDayOfWeek	Gets or sets the **System.DayOfWeek** value determining the first week day.
	Format	Overridden. Gets or sets the format of the content.
	GroupContentConverter	Gets or sets the converter that will be applied to the visual element that is inside the content of each group row. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupContentStyle	Gets or sets the style applied to the title of each group row related to this column. (Inherited from

		C1.Silverlight.DataGrid.DataGridColumn)
	GroupConverter	Gets or sets the converter used to customize the grouping behavior. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupHeader	Gets or sets the header that will appear in the grouping panel as the column header is dragged there. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupState	Gets the grouping state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Header	Gets or sets the content of the header (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HeaderPresenter	Gets the presenter corresponding to the header of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HeaderStyle	Gets or sets the style of the header. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HorizontalAlignment	Gets or sets the horizontal alignment of the cell content regarding the cell. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HorizontalOffset	Gets the horizontal offset in pixels. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Index	Gets the index of a column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsAutoGenerated	Gets a value that indicates whether the column is auto-generated. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsEditable	(Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	IsFrozen	Gets a value indicating whether this column is moved out of the viewport when the user scrolls the data grid. (Inherited from

		C1.Silverlight.DataGrid.DataGridColumn)
	IsMouseOver	Gets a value indicating whether the mouse is over the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsReadOnly	Gets or sets whether the cells in the column are read only. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsSelectable	Gets or sets a value indicating whether the user is allowed to set the current cell from this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsSelected	Gets a value indicating whether this column is selected. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	MaxDate	Gets or sets the maximum **System.DateTime** value allowed. Default value is **System.DateTime.MaxValue**.
	MaxWidth	Gets or sets the maximum width of the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	MinDate	Gets or sets the minimum **System.DateTime** value allowed. Default value is **System.DateTime.MinValue**.
	MinWidth	Gets or sets the minimum width of the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Name	Gets or sets the name of the column. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	SortMemberPath	Gets or sets a property name, or a period-delimited hierarchy of property names, that indicates the member to sort by. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	SortState	Gets the sorting state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

	Tag	Gets or sets the tag. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	TextTrimming	Gets or sets a value indicating whether the text inside the cell allows trimming. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	TextWrapping	Gets or sets a value indicating whether the text inside the cell allows wrapping. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	TimeFormat	Gets or sets the **C1.Silverlight.DateTimeEditors.C1TimeEditorFormat** value determining TimeEditor format.
	VerticalAlignment	Gets or sets the vertical alignment of the cell content regarding the cell. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Visibility	Gets or sets whether the column is visible. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Width	Gets or sets the width of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

Public Methods

	Name	Description
	BeginEdit	Overridden.
	BindCellContent	(Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	CancelCellEdit	Overridden.
	ClearValue	(Inherited from System.Windows.DependencyObject)

	CreateCellContent	Gets a TextBlock that will be used to display the info inside a cell of this column. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	CreateGroupContent	(Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	EndEdit	Overridden.
	GetActualCulture	Gets the culture in which the text and numbers of this columns will be shown. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	GetActualFormat	Gets the format that will be applied in the column considering different sources like Format property or StringFormat of the Binding property. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	GetAnimationBaseValue	(Inherited from System.Windows.DependencyObject)
	GetCellContentRecyclingKey	(Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	GetCellEditingContent	Overridden.
	GetCellText	Gets the text shown inside a cell. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GetCellValue	(Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	GetColumnText	Gets the text shown in the column header. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GetFilter	Overridden.
	GetGroupText	(Inherited from

		C1.Silverlight.DataGrid.DataGridBoundColumn)
	GetValue	(Inherited from System.Windows.DependencyObject)
	PrepareCellForEdit	Overridden.
	ReadLocalValue	(Inherited from System.Windows.DependencyObject)
	SetCellValue	(Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	SetValue	(Inherited from System.Windows.DependencyObject)
	ToString	Returns a **System.String** that represents the current **System.Object**. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	UnbindCellContent	(Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)

Top

Public Events

	Name	Description
	FilterLoading	Occurs before the filter is loaded. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	FilterMemberPathChanged	Occurs when filter member path is changed. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	LoadingFilter	Occurs when the filter is loading. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	PropertyChanged	Occurs when a property value changes. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

	SortMemberPathChanged	Occurs when sort member path is changed. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	VisibilityChanged	Occurs when the visibility changed. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	WidthChanged	Occurs when the column width is changed. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

DataGridDateTimeColumn Constructor(PropertyInfo)

The property info used to initialize the column.

Initializes a new instance of the DataGridDateTimeColumn class.

Syntax

Visual Basic (Declaration)

`Public Function New( _`
`   ByVal property As System.Reflection.PropertyInfo _`
`)`

C#

`public DataGridDateTimeColumn(`
`   System.Reflection.PropertyInfo property`
`)`

Parameters

property

The property info used to initialize the column.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Public Properties

	Name	Description
	ActualCanUserFilter	Gets a value indicating whether a user can perform a filter operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserGroup	Gets a value indicating whether a user can perform a group operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserResize	(Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserSort	Gets a value indicating whether a user can perform a sort operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualFilterMemberPath	Gets the actual FilterMemberPath. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	ActualGroupHeader	(Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualSortMemberPath	Gets the actual SortMemberPath. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	ActualWidth	Gets the actual width in pixels. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	AllowNull	Gets or sets a value indicating whether the editing control allows null values. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)

	Binding	Gets or sets the binding object used to bind the visual element against the data. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	CanUserFilter	Gets or sets a value indicating whether the user can filter by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserGroup	Gets or sets a value indicating whether the user can group by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserMove	Gets or sets a value that indicates whether the user can change the column display order by dragging column headers with the mouse. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserResize	Gets or sets whether the user can resize the column by dragging the border on the right of the column header presenter. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserResizeRows	Gets or sets whether the user can resize the rows manipulating cells in this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserSort	Gets or sets a value indicating whether the user can sort by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CellContentStyle	Gets or sets the style applied to the content of a cell in read mode. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CellEditingContentStyle	Gets or sets the style applied to the content of a cell in edit mode. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CellStyle	Gets or sets the style applied to every cell of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CustomDateFormat	Gets or sets the format that will be applied to the date picker. This property only applied if EditMode is DataTime or Date.

	CustomTimeFormat	Gets or sets the format that will be applied to the time editor.
	DataGrid	Gets the owner data grid. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	DateFormat	Gets or sets the **System.Windows.Controls.DatePickerFormat** value determining DatePicker format.
	DefaultConverter	Overridden.
	Dispatcher	(Inherited from System.Windows.DependencyObject)
	DisplayIndex	Gets or sets the desired index in which the column will be displayed. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	EditMode	Gets or sets the DataGridDateTimeColumnEditMode value determining column representation. The default value is DataGridDateTimeColumnEditMode.DateTime.
	EditOnSelection	Gets or sets a value indicating how the cells enters in edit mode when the user clicks on a cell of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Filter	Gets or sets the filter used in this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	FilterMemberPath	Gets or sets a property name, or a period-delimited hierarchy of property names, that indicates the member to filter by. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	FilterState	Gets the filter state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	FirstDayOfWeek	Gets or sets the **System.DayOfWeek** value determining the first week day.

	Format	Overridden. Gets or sets the format of the content.
	GroupContentConverter	Gets or sets the converter that will be applied to the visual element that is inside the content of each group row. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupContentStyle	Gets or sets the style applied to the title of each group row related to this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupConverter	Gets or sets the converter used to customize the grouping behavior. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupHeader	Gets or sets the header that will appear in the grouping panel as the column header is dragged there. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupState	Gets the grouping state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Header	Gets or sets the content of the header (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HeaderPresenter	Gets the presenter corresponding to the header of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HeaderStyle	Gets or sets the style of the header. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HorizontalAlignment	Gets or sets the horizontal alignment of the cell content regarding the cell. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HorizontalOffset	Gets the horizontal offset in pixels. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Index	Gets the index of a column. (Inherited from

		C1.Silverlight.DataGrid.DataGridColumn)
	IsAutoGenerated	Gets a value that indicates whether the column is auto-generated. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsEditable	(Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	IsFrozen	Gets a value indicating whether this column is moved out of the viewport when the user scrolls the data grid. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsMouseOver	Gets a value indicating whether the mouse is over the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsReadOnly	Gets or sets whether the cells in the column are read only. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsSelectable	Gets or sets a value indicating whether the user is allowed to set the current cell from this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsSelected	Gets a value indicating whether this column is selected. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	MaxDate	Gets or sets the maximum **System.DateTime** value allowed. Default value is **System.DateTime.MaxValue**.
	MaxWidth	Gets or sets the maximum width of the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	MinDate	Gets or sets the minimum **System.DateTime** value allowed. Default value is **System.DateTime.MinValue**.
	MinWidth	Gets or sets the minimum width of the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Name	Gets or sets the name of the column. (Inherited from

		C1.Silverlight.DataGrid.DataGridBoundColumn)
	SortMemberPath	Gets or sets a property name, or a period-delimited hierarchy of property names, that indicates the member to sort by. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	SortState	Gets the sorting state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Tag	Gets or sets the tag. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	TextTrimming	Gets or sets a value indicating whether the text inside the cell allows trimming. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	TextWrapping	Gets or sets a value indicating whether the text inside the cell allows wrapping. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	TimeFormat	Gets or sets the **C1.Silverlight.DateTimeEditors.C1TimeEditorFormat** value determining TimeEditor format.
	VerticalAlignment	Gets or sets the vertical alignment of the cell content regarding the cell. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Visibility	Gets or sets whether the column is visible. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Width	Gets or sets the width of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

CustomDateFormat Property

Gets or sets the format that will be applied to the date picker. This property only applied if EditMode is DataTime or Date.

Syntax

Visual Basic (Declaration)

```
Public Property CustomDateFormat As System.String
```

C#

```
public System.string CustomDateFormat {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CustomTimeFormat Property

Gets or sets the format that will be applied to the time editor.

Syntax

Visual Basic (Declaration)

```
Public Property CustomTimeFormat As System.String
```

C#

```
public System.string CustomTimeFormat {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

DataGridDateTimeColumn Members

DateFormat Property

Gets or sets the **System.Windows.Controls.DatePickerFormat** value determining DatePicker format.

Syntax

Visual Basic (Declaration)

```
Public Property DateFormat As
C1.Silverlight.DateTimeEditors.C1DatePickerFormat
```

C#

```
public C1.Silverlight.DateTimeEditors.C1DatePickerFormat DateFormat {get;
set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

DataGridDateTimeColumn Members

DefaultConverter Property

Syntax

Visual Basic (Declaration)

```
Public Overrides ReadOnly Property DefaultConverter As
```

System.Windows.Data.IValueConverter
C#
`public override System.Windows.Data.IValueConverter DefaultConverter {get;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

EditMode Property

Gets or sets the DataGridDateTimeColumnEditMode value determining column representation. The default value is DataGridDateTimeColumnEditMode.DateTime.

Syntax

Visual Basic (Declaration)
`Public Property EditMode As DataGridDateTimeColumnEditMode`
C#
`public DataGridDateTimeColumnEditMode EditMode {get; set;}`

Remarks

If Format property value has not been changed by external code, it is set according to the EditMode property value:

EditMode	Format
DataGridDateTimeColumnEditMode.DateTime	g
DataGridDateTimeColumnEditMode.Date	d
DataGridDateTimeColumnEditMode.Time	t

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

FirstDayOfWeek Property

Gets or sets the **System.DayOfWeek** value determining the first week day.

Syntax

Visual Basic (Declaration)
`Public Property FirstDayOfWeek As System.DayOfWeek`
C#
`public System.DayOfWeek FirstDayOfWeek {get; set;}`

Remarks

This property only makes sense if you set it from your code or xaml. Otherwise, the actual value depends on the DataGrid.Language property value.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Format Property

Gets or sets the format of the content.

Syntax

Visual Basic (Declaration)	
`Public Overrides Property Format As System.String`	
C#	
`public override System.string Format {get; set;}`	

Remarks

If Format property value has not been changed by external code, it is set according to the EditMode property value:

EditMode	Format
DataGridDateTimeColumnEditMode.DateTime	g
DataGridDateTimeColumnEditMode.Date	d
DataGridDateTimeColumnEditMode.Time	t

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

MaxDate Property

Gets or sets the maximum **System.DateTime** value allowed. Default value is **System.DateTime.MaxValue**.

Syntax

Visual Basic (Declaration)	
`Public Property MaxDate As System.Date`	

C#

```
public System.DateTime MaxDate {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

MinDate Property

Gets or sets the minimum **System.DateTime** value allowed. Default value is **System.DateTime.MinValue**.

Syntax

Visual Basic (Declaration)

```
Public Property MinDate As System.Date
```

C#

```
public System.DateTime MinDate {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Convert Method

The source data being passed to the target.

The **System.Type** of data expected by the target dependency property.

An optional parameter to be used in the converter logic.

The culture of the conversion.

Modifies the source data before passing it to the target for display in the UI.

Syntax

Visual Basic (Declaration)

```
Public Overrides Function Convert( _
   ByVal value As System.Object, _
   ByVal targetType As System.Type, _
   ByVal parameter As System.Object, _
   ByVal culture As System.Globalization.CultureInfo _
) As System.Object
```

C#

```
public override System.object Convert(
   System.object value,
   System.Type targetType,
   System.object parameter,
   System.Globalization.CultureInfo culture
)
```

Parameters

value

The source data being passed to the target.

targetType

The **System.Type** of data expected by the target dependency property.

parameter

An optional parameter to be used in the converter logic.

culture

The culture of the conversion.

Return Value

The value to be passed to the target dependency property.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ConvertBack Method

The target data being passed to the source.

The **System.Type** of data expected by the source object.

An optional parameter to be used in the converter logic.

The culture of the conversion.

Modifies the target data before passing it to the source object. This method is called only in **System.Windows.Data.BindingMode.TwoWay** bindings.

Syntax

Visual Basic (Declaration)	
`Public Overrides Function ConvertBack( _`	

```
   ByVal value As System.Object, _
   ByVal targetType As System.Type, _
   ByVal parameter As System.Object, _
   ByVal culture As System.Globalization.CultureInfo _
) As System.Object
```

C#

```
public override System.object ConvertBack(
   System.object value,
   System.Type targetType,
   System.object parameter,
   System.Globalization.CultureInfo culture
)
```

Parameters

value

The target data being passed to the source.

targetType

The **System.Type** of data expected by the source object.

parameter

An optional parameter to be used in the converter logic.

culture

The culture of the conversion.

Return Value

The value to be passed to the source object.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Create Method

Creates the filter based on the current filter criteria set by the user in the filter control. Raises the FilterChanged event if necessary.

Syntax

Visual Basic (Declaration)
`Public Sub Create()`
C#
`public void Create()`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Load Method

the desired state.

Initializes the filter and filter control to the desired state.

Syntax

Visual Basic (Declaration)

```
Public Sub Load( _
   ByVal filterState As DataGridFilterState _
)
```

C#

```
public void Load(
   DataGridFilterState filterState
)
```

Parameters

filterState

the desired state.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

OnApplyTemplate Method

Builds the visual tree for the DataGridDateTimeFilter control when a new template is applied.

Syntax

Visual Basic (Declaration)

```
Public Overrides Sub OnApplyTemplate()
```

C#

```
public override void OnApplyTemplate()
```

Remarks

This method is invoked whenever application code or an internal process, such as a rebuilding layout pass, calls the **ApplyTemplate** method.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Public Properties

	Name	Description
	ActualHeight	(Inherited from System.Windows.FrameworkElement)
	ActualWidth	(Inherited from System.Windows.FrameworkElement)
	AllowDrop	(Inherited from System.Windows.UIElement)
	Background	(Inherited from System.Windows.Controls.Control)
	BorderBrush	(Inherited from System.Windows.Controls.Control)
	BorderThickness	(Inherited from System.Windows.Controls.Control)
	CacheMode	(Inherited from System.Windows.UIElement)
	CharacterSpacing	(Inherited from System.Windows.Controls.Control)
	Clip	(Inherited from System.Windows.UIElement)

	Cursor	(Inherited from System.Windows.FrameworkElement)
	DataContext	(Inherited from System.Windows.FrameworkElement)
	DateFormat	Specifies the C1DatePickerFormat format that is used to display the selected date.
	DesiredSize	(Inherited from System.Windows.UIElement)
	Dispatcher	(Inherited from System.Windows.DependencyObject)
	EditMode	Defines edit mode.
	Effect	(Inherited from System.Windows.UIElement)
	EndDate	Gets or sets the end date shown in the filter control.
	Filter	Gets or sets the filter shown in the unity.
	FirstDayOfWeek	Gets or sets the day that is considered the beginning of the week.
	FlowDirection	(Inherited from System.Windows.FrameworkElement)
	FocusBrush	Gets or sets the **System.Windows.Media.Brush** used to highlight the focused control.
	FontFamily	(Inherited from System.Windows.Controls.Control)
	FontSize	(Inherited from System.Windows.Controls.Control)
	FontStretch	(Inherited from System.Windows.Controls.Control)
	FontStyle	(Inherited from System.Windows.Controls.Control)
	FontWeight	(Inherited from System.Windows.Controls.Control)
	Foreground	(Inherited from System.Windows.Controls.Control)

	Height	(Inherited from System.Windows.FrameworkElement)
	HorizontalAlignment	(Inherited from System.Windows.FrameworkElement)
	HorizontalContentAlignment	(Inherited from System.Windows.Controls.Control)
	InputBackground	Gets or sets the **System.Windows.Media.Brush** that fills the background of the input control.
	InputForeground	Gets or sets the **System.Windows.Media.Brush** applied to the text inside an input control when this text is not selected.
	IsEnabled	(Inherited from System.Windows.Controls.Control)
	IsHitTestVisible	(Inherited from System.Windows.UIElement)
	IsTabStop	(Inherited from System.Windows.Controls.Control)
	Language	(Inherited from System.Windows.FrameworkElement)
	Margin	(Inherited from System.Windows.FrameworkElement)
	MaxHeight	(Inherited from System.Windows.FrameworkElement)
	MaxWidth	(Inherited from System.Windows.FrameworkElement)
	MinHeight	(Inherited from System.Windows.FrameworkElement)
	MinWidth	(Inherited from System.Windows.FrameworkElement)
	MouseOverBrush	Gets or sets the **System.Windows.Media.Brush** used to highlight the control when it has the mouse over.
	Name	(Inherited from System.Windows.FrameworkElement)
	Opacity	(Inherited from System.Windows.UIElement)

	OpacityMask	(Inherited from System.Windows.UIElement)
	Padding	(Inherited from System.Windows.Controls.Control)
	Parent	(Inherited from System.Windows.FrameworkElement)
	PressedBrush	Gets or sets the **System.Windows.Media.Brush** used to paint a button when it is pressed.
	Projection	(Inherited from System.Windows.UIElement)
	RenderSize	(Inherited from System.Windows.UIElement)
	RenderTransform	(Inherited from System.Windows.UIElement)
	RenderTransformOrigin	(Inherited from System.Windows.UIElement)
	Resources	(Inherited from System.Windows.FrameworkElement)
	SelectedBackground	Gets or sets the **System.Windows.Media.Brush** used to highlight the control when it is selected.
	StartDate	Gets or sets the start date shown in the filter control.
	Style	(Inherited from System.Windows.FrameworkElement)
	TabIndex	(Inherited from System.Windows.Controls.Control)
	TabNavigation	(Inherited from System.Windows.Controls.Control)
	Tag	(Inherited from System.Windows.FrameworkElement)
	Template	(Inherited from System.Windows.Controls.Control)
	TimeFormat	Specifies the C1TimeEditorFormat format that is used to display the selected time.
	Triggers	(Inherited from System.Windows.FrameworkElement)

	UseLayoutRounding	(Inherited from System.Windows.UIElement)
	VerticalAlignment	(Inherited from System.Windows.FrameworkElement)
	VerticalContentAlignment	(Inherited from System.Windows.Controls.Control)
	Visibility	(Inherited from System.Windows.UIElement)
	Width	(Inherited from System.Windows.FrameworkElement)

EndDate Property

Gets or sets the end date shown in the filter control.

Syntax

Visual Basic (Declaration)

```
Public Property EndDate As System.Nullable(Of Date)
```

C#

```
public System.Nullable<DateTime> EndDate {get; set;}
```

Property Value

The end date shown in the filter control, if null no value will be shown.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Filter Property

Gets or sets the filter shown in the unity.

Syntax

Visual Basic (Declaration)

```
Public Property Filter As DataGridFilterState
```

C#

```
public DataGridFilterState Filter {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

FirstDayOfWeek Property

Gets or sets the day that is considered the beginning of the week.

Syntax

Visual Basic (Declaration)

```
Public Property FirstDayOfWeek As System.DayOfWeek
```

C#

```
public System.DayOfWeek FirstDayOfWeek {get; set;}
```

Remarks

This property only makes sense if you set it or corresponding property of the owning DataGridDateTimeColumn from your code or xaml. Otherwise, the actual value depends on the DataGrid.Language property value.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

FilterChanged Event

Occurs when the filter criteria changes.

Syntax

Visual Basic (Declaration)
`Public Event FilterChanged As System.EventHandler(Of PropertyChangedEventArgs(Of DataGridFilterState))`
C#
`public event System.EventHandler<PropertyChangedEventArgs<DataGridFilterState>> FilterChanged`

Event Data

The event handler receives an argument of type C1.Silverlight.PropertyChangedEventArgs<T> containing data related to this event. The following **PropertyChangedEventArgs<T>** properties provide information specific to this event.

Property	Description
NewValue	
OldValue	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Members

Properties Methods

The following tables list the members exposed by DataGridDefaultInputHandlingStrategy.

Public Constructors

	Name	Description
	DataGridDefaultInputHandlingStrategy Constructor	Initializes a new instance of the DataGridDefaultInputHandlingStrategy class.

Top

Public Properties

	Name	Description
	DataGrid	Gets the owner data grid.
	SelectionManager	Gets the selection manager which allow you to manipulate the selection.

Top

Public Methods

	Name	Description
	GetBottomCell	Gets the bottom visible cell regarding to the current cell.
	GetBottomVisibleRow	Gets the bottom visible row.
	GetClipboardContent	Gets the text that will be the content of the clipboard.
	GetLeftMostCell	Gets the left most visible cell regarding to the current cell.
	GetLeftMostVisibleColumn	Gets the left most visible column.
	GetNextEditableCell	Gets the next editable cell regarding to the current cell.
	GetNextVisibleColumn	Gets the next visible column regarding to the current column.
	GetNextVisibleRow	Gets the next visible row regarding to the current row.
	GetPreviousEditableCell	Gets the previous editable cell regarding to the current cell.
	GetPreviousVisibleColumn	Gets the previous visible column regarding to the current column.
	GetPreviousVisibleRow	Gets the previous visible row regarding to the current row.
	GetRightMostCell	Gets the right most visible cell regarding to the current cell.

	GetRightMostVisibleColumn	Gets the right most visible column.
	GetTopCell	Gets the top visible cell regarding to the current cell.
	GetTopVisibleRow	Gets the top visible row.
	GoToBottomCell	Goes to bottom cell.
	GoToDownCell	Overloaded. Goes to down cell.
	GoToFirstCell	Goes to first cell.
	GoToLastCell	Goes to last cell.
	GoToLeftCell	Overloaded. Goes to the cell on the left.
	GoToLeftMostCell	Overloaded. Goes to left most cell.
	GoToRightCell	Overloaded. Goes to the cell on the right.
	GoToRightMostCell	Overloaded. Goes to right most cell.
	GoToTopCell	Goes to top cell.
	GoToUpCell	Overloaded. Goes to up cell.
	HandleKeyDown	Handles the key down.
	SetClipboardContent	Gets the text that will be the content of the clipboard.
	SetCurrentCell	Sets the current cell.

DataGridDefaultInputHandlingStrategy Constructor

The data grid.

Initializes a new instance of the DataGridDefaultInputHandlingStrategy class.

Syntax

Visual Basic (Declaration)

`Public Function New( _`
`   ByVal dataGrid As C1DataGrid _`
`)`

C#

`public DataGridDefaultInputHandlingStrategy(`
`   C1DataGrid dataGrid`
`)`

Parameters

dataGrid

The data grid.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GetBottomCell Method

The current cell.

Gets the bottom visible cell regarding to the current cell.

Syntax

Visual Basic (Declaration)

```
Public Overridable Function GetBottomCell( _
   ByVal currentCell As DataGridCell _
```

```
) As DataGridCell
```

C#

```
public virtual DataGridCell GetBottomCell(
   DataGridCell currentCell
)
```

Parameters

currentCell

The current cell.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GetBottomVisibleRow Method

The data grid.

Gets the bottom visible row.

Syntax

Visual Basic (Declaration)

```
Public Overridable Function GetBottomVisibleRow( _
   ByVal dataGrid As C1DataGrid _
) As DataGridRow
```

C#

```
public virtual DataGridRow GetBottomVisibleRow(
   C1DataGrid dataGrid
)
```

Parameters

dataGrid

The data grid.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GetClipboardContent Method

Gets the text that will be the content of the clipboard.

Syntax

Visual Basic (Declaration)
`Public Overridable Function GetClipboardContent() As System.String`
C#
`public virtual System.string GetClipboardContent()`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GetLeftMostCell Method

The current cell.

Gets the left most visible cell regarding to the current cell.

Syntax

Visual Basic (Declaration)

```
Public Overridable Function GetLeftMostCell( _
   ByVal currentCell As DataGridCell _
) As DataGridCell
```

C#

```
public virtual DataGridCell GetLeftMostCell(
   DataGridCell currentCell
)
```

Parameters

currentCell

The current cell.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GetLeftMostVisibleColumn Method

The data grid.

Gets the left most visible column.

Syntax

Visual Basic (Declaration)

```
Public Overridable Function GetLeftMostVisibleColumn( _
   ByVal dataGrid As C1DataGrid _
) As DataGridColumn
```

C#

```
public virtual DataGridColumn GetLeftMostVisibleColumn(
```

```
   C1DataGrid dataGrid
)
```

Parameters

dataGrid

The data grid.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GetNextEditableCell Method

The current cell.

Gets the next editable cell regarding to the current cell.

Syntax

Visual Basic (Declaration)

```
Public Overridable Function GetNextEditableCell( _
   ByVal currentCell As DataGridCell _
) As DataGridCell
```

C#

```
public virtual DataGridCell GetNextEditableCell(
   DataGridCell currentCell
)
```

Parameters

currentCell

The current cell.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GetNextVisibleColumn Method

The current column.

Gets the next visible column regarding to the current column.

Syntax

Visual Basic (Declaration)

```
Public Overridable Function GetNextVisibleColumn( _
   ByVal currentColumn As DataGridColumn _
) As DataGridColumn
```

C#

```
public virtual DataGridColumn GetNextVisibleColumn(
   DataGridColumn currentColumn
)
```

Parameters

currentColumn

The current column.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GetNextVisibleRow Method

The current row.

Gets the next visible row regarding to the current row.

Syntax

Visual Basic (Declaration)

```
Public Overridable Function GetNextVisibleRow( _
   ByVal currentRow As DataGridRow _
) As DataGridRow
```

C#

```
public virtual DataGridRow GetNextVisibleRow(
   DataGridRow currentRow
)
```

Parameters

currentRow

The current row.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GetPreviousEditableCell Method

The current cell.

Gets the previous editable cell regarding to the current cell.

Syntax

Visual Basic (Declaration)

```
Public Overridable Function GetPreviousEditableCell( _
   ByVal currentCell As DataGridCell _
) As DataGridCell
```

C#

```
public virtual DataGridCell GetPreviousEditableCell(
   DataGridCell currentCell
)
```

Parameters

currentCell

The current cell.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GetRightMostCell Method

The current cell.

Gets the right most visible cell regarding to the current cell.

Syntax

Visual Basic (Declaration)

```
Public Overridable Function GetRightMostCell( _
   ByVal currentCell As DataGridCell _
) As DataGridCell
```

C#

```
public virtual DataGridCell GetRightMostCell(
   DataGridCell currentCell
)
```

Parameters

currentCell

The current cell.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GoToBottomCell Method

The current cell.

if set to `true` act as if the shift key were pressed.

if set to `true` act as if the ctrl key were pressed.

Goes to bottom cell.

Syntax

Visual Basic (Declaration)

```
Public Overridable Function GoToBottomCell( _
   ByVal currentCell As DataGridCell, _
   ByVal shift As System.Boolean, _
   ByVal ctrl As System.Boolean _
) As System.Boolean
```

C#

```
public virtual System.bool GoToBottomCell(
   DataGridCell currentCell,
   System.bool shift,
   System.bool ctrl
)
```

Parameters

currentCell

The current cell.

shift

if set to `true` act as if the shift key were pressed.

ctrl

if set to `true` act as if the ctrl key were pressed.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GoToFirstCell Method

The data grid.

if set to `true` act as if the shift key were pressed.

if set to `true` act as if the ctrl key were pressed.

Goes to first cell.

Syntax

Visual Basic (Declaration)

```
Public Overridable Function GoToFirstCell( _
   ByVal dataGrid As C1DataGrid, _
   ByVal shift As System.Boolean, _
   ByVal ctrl As System.Boolean _
) As System.Boolean
```

C#

```
public virtual System.bool GoToFirstCell(
   C1DataGrid dataGrid,
   System.bool shift,
   System.bool ctrl
)
```

Parameters

dataGrid

The data grid.

shift

if set to `true` act as if the shift key were pressed.

ctrl

if set to `true` act as if the ctrl key were pressed.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GoToLastCell Method

The data grid.

if set to `true` act as if the shift key were pressed.

if set to `true` act as if the ctrl key were pressed.

Goes to last cell.

Syntax

Visual Basic (Declaration)

```
Public Overridable Function GoToLastCell( _
   ByVal dataGrid As C1DataGrid, _
   ByVal shift As System.Boolean, _
   ByVal ctrl As System.Boolean _
) As System.Boolean
```

C#

```
public virtual System.bool GoToLastCell(
   C1DataGrid dataGrid,
   System.bool shift,
   System.bool ctrl
)
```

Parameters

dataGrid

The data grid.

shift

if set to `true` act as if the shift key were pressed.

ctrl

if set to `true` act as if the ctrl key were pressed.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GoToUpCell(DataGridCell,Boolean,Boolean) Method
The current cell.

if set to `true` act as if the shift key were pressed.

if set to `true` act as if the ctrl key were pressed.

Goes to up cell.

Syntax

Visual Basic (Declaration)

```
Public Overloads Overridable Function GoToUpCell( _
   ByVal currentCell As DataGridCell, _
   ByVal shift As System.Boolean, _
   ByVal ctrl As System.Boolean _
) As System.Boolean
```

C#

```
public virtual System.bool GoToUpCell(
   DataGridCell currentCell,
   System.bool shift,
   System.bool ctrl
)
```

Parameters

currentCell

The current cell.

shift

if set to `true` act as if the shift key were pressed.

ctrl

if set to `true` act as if the ctrl key were pressed.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Overload List

HandleKeyDown Method

The **System.Windows.Input.KeyEventArgs** instance containing the event data.

Handles the key down.

Syntax

Visual Basic (Declaration)

```
Public Overridable Sub HandleKeyDown( _
   ByVal e As System.Windows.Input.KeyEventArgs _
)
```

C#

```
public virtual void HandleKeyDown(
   System.Windows.Input.KeyEventArgs e
)
```

Parameters

e

The **System.Windows.Input.KeyEventArgs** instance containing the event data.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

SetClipboardContent Method

Gets the text that will be the content of the clipboard.

Syntax

Visual Basic (Declaration)

```
Public Overridable Sub SetClipboardContent( _
   ByVal clipboardContent As System.String _
)
```

C#

```
public virtual void SetClipboardContent(
   System.string clipboardContent
)
```

Parameters

clipboardContent

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

SetCurrentCell Method

The cell.

if set to `true` act as if the shift key were pressed.

if set to `true` act as if the ctrl key were pressed.

Sets the current cell.

Syntax

Visual Basic (Declaration)

```
Public Overridable Function SetCurrentCell( _
   ByVal cell As DataGridCell, _
   ByVal shift As System.Boolean, _
   ByVal ctrl As System.Boolean _
) As System.Boolean
```

C#

```
public virtual System.bool SetCurrentCell(
   DataGridCell cell,
   System.bool shift,
   System.bool ctrl
)
```

Parameters

cell

The cell.

shift

if set to `true` act as if the shift key were pressed.

ctrl

if set to `true` act as if the ctrl key were pressed.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

DataGrid Property
Gets the data grid the detail belongs to.

Syntax

Visual Basic (Declaration)
`Public ReadOnly Property DataGrid As C1DataGrid`
C#
`public C1DataGrid DataGrid {get;}`

Property Value

The data grid.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

HorizontalGridLineVisibility Property

Gets or sets the visibility of the horizontal grid lines of this row, If true, the horizontal grid lines are shown.

Syntax

Visual Basic (Declaration)

```
Public Property HorizontalGridLineVisibility As System.Windows.Visibility
```

C#

```
public System.Windows.Visibility HorizontalGridLineVisibility {get; set;}
```

Remarks

This property is controlled by the C1DataGrid to which the presenter belongs.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Members

Properties

The following tables list the members exposed by DataGridEndingEditEventArgs.

Public Properties

	Name	Description
	Cancel	Gets or sets a value indicating whether the event is canceled.
	Column	Gets the column corresponding to the editing cell.
	EditingElement	Gets the editing **System.Windows.FrameworkElement**.
	Row	Gets the row corresponding to the editing cell.

Cancel Property

Gets or sets a value indicating whether the event is canceled.

Syntax

Visual Basic (Declaration)

```
Public Property Cancel As System.Boolean
```

C#

```
public System.bool Cancel {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Column Property

Gets the column corresponding to the editing cell.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property Column As DataGridColumn
```

C#

```
public DataGridColumn Column {get;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

EditingElement Property

Gets the editing **System.Windows.FrameworkElement**.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property EditingElement As System.Windows.FrameworkElement
```

C#

```
public System.Windows.FrameworkElement EditingElement {get;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Row Property

Gets the row corresponding to the editing cell.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property Row As DataGridRow
```

C#

```
public DataGridRow Row {get;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Clear Method

Clears the current filter criteria and the values contained in the filter control.

Syntax

Visual Basic (Declaration)

```
Public Sub Clear()
```

C#

```
public void Clear()
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

DataGridFilter Class
DataGridFilter Members

Create Method

Creates the filter based on the current filter criteria set by the user in the filter control. Raises the FilterChanged event if necessary.

Syntax

Visual Basic (Declaration)

```
Public Sub Create()
```

C#

```
public void Create()
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

DataGridFilter Class
DataGridFilter Members

Load Method

the desired state.

Initializes the filter and filter control to the desired state.

Syntax

Visual Basic (Declaration)

```
Public Sub Load( _
   ByVal filterState As DataGridFilterState _
)
```

C#

```
public void Load(
   DataGridFilterState filterState
)
```

Parameters

filterState

the desired state.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

OnApplyTemplate Method

Builds the visual tree for the DataGridFilter control when a new template is applied.

Syntax

Visual Basic (Declaration)
`Public Overrides Sub OnApplyTemplate()`
C#
`public override void OnApplyTemplate()`

Remarks

This method is invoked whenever application code or an internal process, such as a rebuilding layout pass, calls the **ApplyTemplate** method.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

InnerControl Property

Gets or sets the inner filter control.

Syntax

Visual Basic (Declaration)

```
Public Property InnerControl As IDataGridFilter
```

C#

```
public IDataGridFilter InnerControl {get; set;}
```

Property Value

The control used to create and set the filter, it must implement the IDataGridFilter and inherit from Control class.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

PressedBrushProperty Field

Identifies the PressedBrush dependency property.

Syntax

Visual Basic (Declaration)
`Public Shared ReadOnly PressedBrushProperty As System.Windows.DependencyProperty`
C#
`public static readonly System.Windows.DependencyProperty PressedBrushProperty`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

FilterChanged Event

Occurs when the filter criteria changes.

Syntax

Visual Basic (Declaration)	
`Public Event FilterChanged As System.EventHandler(Of PropertyChangedEventArgs(Of DataGridFilterState))`	
C#	

```
public event
System.EventHandler<PropertyChangedEventArgs<DataGridFilterState>>
FilterChanged
```

Event Data

The event handler receives an argument of type C1.Silverlight.PropertyChangedEventArgs<T> containing data related to this event. The following **PropertyChangedEventArgs<T>** properties provide information specific to this event.

Property	Description
NewValue	
OldValue	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Overload List

DataGridFilterException Constructor(String,Exception)

The error message that explains the reason for the exception.

The exception that is the cause of the current exception, or a null reference (Nothing in Visual Basic) if no inner exception is specified.

Initializes a new instance of the DataGridFilterException class.

Syntax

Visual Basic (Declaration)

```
Public Function New( _
   ByVal message As System.String, _
   ByVal innerException As System.Exception _
)
```

C#

```
public DataGridFilterException(
   System.string message,
   System.Exception innerException
)
```

Parameters

message

The error message that explains the reason for the exception.

innerException

The exception that is the cause of the current exception, or a null reference (Nothing in Visual Basic) if no inner exception is specified.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Equals Method

The **System.Object** to compare with this instance.

Determines whether the specified **System.Object**, is equal to this instance.

Syntax

Visual Basic (Declaration)

```
Public Overrides Function Equals( _
   ByVal obj As System.Object _
) As System.Boolean
```

C#

```
public override System.bool Equals(
   System.object obj
)
```

Parameters

obj

The **System.Object** to compare with this instance.

Return Value

`true` if the specified **System.Object** is equal to this instance; otherwise, `false`.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

FilterInfo Property

Gets or sets a list of objects providing basic information that describe the applied filters.

Syntax

Visual Basic (Declaration)

```
Public Property FilterInfo As System.Collections.Generic.List(Of
DataGridFilterInfo)
```

C#

```
public System.Collections.Generic.List<DataGridFilterInfo> FilterInfo {get;
set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Tag Property

Gets or sets an arbitrary object value that can be used to store custom information about the filter.

Syntax

Visual Basic (Declaration)

```
Public Property Tag As System.Object
```

C#

```
public System.object Tag {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

C1.Silverlight.DataGrid Namespace

DataGridGroupingPresenter Constructor

Initializes a new instance of a DataGridGroupingPresenter.

Syntax

Visual Basic (Declaration)
`Public Function New()`
C#
`public DataGridGroupingPresenter()`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

OnApplyTemplate Method

Builds the visual tree for the DataGridGroupingPresenter control when a new template is applied.

Syntax

Visual Basic (Declaration)
`Public Overrides Sub OnApplyTemplate()`
C#
`public override void OnApplyTemplate()`

Remarks

This method is invoked whenever application code or an internal process, such as a rebuilding layout pass, calls the **ApplyTemplate** method.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IsEmpty Property

Gets or sets a value indicating whether the grouping panel is empty or not.

Syntax

Visual Basic (Declaration)

```
Public Property IsEmpty As System.Boolean
```

C#

```
public System.bool IsEmpty {get; set;}
```

Remarks

If this property is set to false the visual state group "GroupingStates" will change its visual state to "Grouping".

This property is controlled by the C1DataGrid to which the presenter belongs.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Panel Property
Gets the grouping panel.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property Panel As DataGridGroupingPanel
```

C#

```
public DataGridGroupingPanel Panel {get;}
```

Property Value

The grouping panel.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GroupsChanged Event

Occurs when the groups changed.

Syntax

Visual Basic (Declaration)	
`Public Event GroupsChanged As System.Windows.RoutedEventHandler`	
C#	
`public event System.Windows.RoutedEventHandler GroupsChanged`	

Event Data

The event handler receives an argument of type System.Windows.RoutedEventArgs containing data related to this event. The following **RoutedEventArgs** properties provide information specific to this event.

Property	Description
OriginalSource	Gets a reference to the object that raised the event.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Public Constructors

	Name	Description
	DataGridGroupRow Constructor	

Top

Public Properties

	Name	Description
	ActualCanUserToggleDetails	Gets or sets a value indicating whether the user can toggle details, taking in consideration properties of the containing DataGrid. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	ActualDetailsVisibility	Gets a value indicating whether this row is showing details, taking in consideration properties of the containing DataGrid. (Inherited from

		C1.Silverlight.DataGrid.DataGridRow)
	ActualHeight	Gets the actual height in pixels. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	ActualHeightWithoutDetails	Gets the actual height in pixels (without the details). (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	CanUserResize	Gets or sets a value indicating whether this row can be resized by the user. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	CanUserToggleDetails	Gets or sets a value indicating whether the user can toggle details. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	CellStyle	Gets or sets the style applied to all the cells of this row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	Column	Gets the column related to the group.
	DataGrid	Gets the data grid to which the row belongs. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	DataItem	Gets the data of the row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	DetailsPresenter	Gets the visual element that will be arranged at the bottom of the row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	DetailsVisibility	Gets or sets a value indicating whether this row is showing details. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	Dispatcher	(Inherited from System.Windows.DependencyObject)

	Errors	Gets the collection of errors associated with this row. Add errors here if you want to display an error message in the corresponding row header. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	GroupKeys	Gets keys that identify the group.
	GroupRowsVisibility	Gets or sets the visibility of the rows related to the group.
	HeaderPresenter	Gets the visual element that represent the header of this row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	Height	Gets or sets the height of this row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	IndentWidth	Gets the distance between the row header and the first cell of the row. This empty space is only present when there are groups in the data grid. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	Index	Gets the index of the row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	IsEditable	Gets a value indicating whether this row is editable. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	IsEditing	Gets or sets a value indicating whether this row is editing. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	IsMouseOver	Gets a value indicating whether the mouse is over the row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	IsSelectable	Gets or sets a value indicating whether the user is allowed to set the current cell from this row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	IsSelected	Gets a value indicating whether this row is selected.

		(Inherited from C1.Silverlight.DataGrid.DataGridRow)
	Level	Overridden.
	MaxHeight	Gets or sets the maximum height (in pixels) allowed. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	MinHeight	Gets or sets the minimum height (in pixels) allowed. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	ParentCollection	Gets the collection of rows to which this row belongs. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	ParentGroup	Gets the parent group. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	Presenter	Gets the visual element that represent this row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	RowHeaderStyle	Gets or sets the style applied to the row header presenter of this row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	Rows	Gets the rows inside the group.
	RowStyle	Gets or sets the style of the row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	ShowVerticalFreezingSeparator	Gets a value indicating whether to show vertical freezing separator. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	Type	Gets the type of row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	ValidationResults	Gets the collection of errors associated with this row. Add errors here if you want to display an error message in the corresponding row header. (Inherited from

		C1.Silverlight.DataGrid.DataGridRow)
	VerticalOffset	Gets the vertical offset in pixels. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	Visibility	Gets or sets the visibility of the row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)

Top

Public Methods

	Name	Description
	ClearValue	(Inherited from System.Windows.DependencyObject)
	GetAnimationBaseValue	(Inherited from System.Windows.DependencyObject)
	GetCellPresenter	(Inherited from C1.Silverlight.DataGrid.DataGridRow)
	GetGroupText	
	GetValue	(Inherited from System.Windows.DependencyObject)
	ReadLocalValue	(Inherited from System.Windows.DependencyObject)
	Refresh	Unload every visual element which is related to the row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	SetValue	(Inherited from System.Windows.DependencyObject)
	ToString	Returns a **System.String** that represents the current **System.Object**. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	Validate	Overloaded. Validates the DataGridRow.DataItem. Implement IDataErrorInfo or INotifyDataErrorInfo in order to implement your own validation rules. (Inherited from

		C1.Silverlight.DataGrid.DataGridRow)

	MinHeight	Gets or sets the minimum height (in pixels) allowed. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	ParentCollection	Gets the collection of rows to which this row belongs. (Inherited from C1.Silverlight.DataGrid.DataGridRow)

	ParentGroup	Gets the parent group. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	Presenter	Gets the visual element that represent this row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	RowHeaderStyle	Gets or sets the style applied to the row header presenter of this row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	Rows	Gets the rows inside the group.
	RowStyle	Gets or sets the style of the row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	ShowVerticalFreezingSeparator	Gets a value indicating whether to show vertical freezing separator. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	Type	Gets the type of row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	ValidationResults	Gets the collection of errors associated with this row. Add errors here if you want to display an error message in the corresponding row header. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	VerticalOffset	Gets the vertical offset in pixels. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	Visibility	Gets or sets the visibility of the row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)

Column Property

Gets the column related to the group.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property Column As DataGridColumn
```

C#

```
public DataGridColumn Column {get;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GroupKeys Property

Gets keys that identify the group.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property GroupKeys As System.Object()
```

C#

```
public System.object[] GroupKeys {get;}
```

Property Value

The group keys.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GroupRowsVisibility Property

Gets or sets the visibility of the rows related to the group.

Syntax

Visual Basic (Declaration)

```
Public Property GroupRowsVisibility As System.Windows.Visibility
```

C#

```
public System.Windows.Visibility GroupRowsVisibility {get; set;}
```

Property Value

The visibility of the rows related to the group.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Level Property

Syntax

Visual Basic (Declaration)

```
Public Overrides ReadOnly Property Level As System.Integer
```

C#

```
public override System.int Level {get;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Rows Property
Gets the rows inside the group.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property Rows As DataGridRowCollection
```

C#

```
public DataGridRowCollection Rows {get;}
```

Property Value

The rows inside the group.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

" -->

For a list of all members of this type, see DataGridGroupRow members.

Public Events

	Name	Description
	CanUserResizeChanged	Occurs after the DataGridRow.CanUserResize value changed. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	CanUserToggleDetailsChanged	Occurs after the DataGridRow.CanUserToggleDetails value changed. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	DetailsVisibilityChanged	Occurs after the visibility of the details of the row changed. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	GroupRowsVisibilityChanged	Occurs when the rows related to the group visibility changed.
	HeightChanged	Occurs after the height was changed. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	IsEditingChanged	Occurs when the IsEditing value changed. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	Loaded	Occurs after the row is added to the collection of rows. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	PropertyChanged	Occurs when a property value changes. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	VisibilityChanged	Occurs after the visibility of the row changed. (Inherited from C1.Silverlight.DataGrid.DataGridRow)

GroupRowsVisibilityChanged Event

Occurs when the rows related to the group visibility changed.

Syntax

Visual Basic (Declaration)	
`Public Event GroupRowsVisibilityChanged As System.EventHandler(Of PropertyChangedEventArgs(Of Visibility))`	
C#	
`public event System.EventHandler<PropertyChangedEventArgs<Visibility>> GroupRowsVisibilityChanged`	

Event Data

The event handler receives an argument of type C1.Silverlight.PropertyChangedEventArgs<T> containing data related to this event. The following **PropertyChangedEventArgs<T>** properties provide information specific to this event.

Property	Description
NewValue	
OldValue	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Public Properties

	Name	Description
	ActualHeight	(Inherited from System.Windows.FrameworkElement)
	ActualWidth	(Inherited from System.Windows.FrameworkElement)
	AllowDrop	(Inherited from System.Windows.UIElement)
	Background	(Inherited from System.Windows.Controls.Control)
	BackgroundBrush	Gets or sets the **System.Windows.Media.Brush** used in the background of the row. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)

	BorderBrush	(Inherited from System.Windows.Controls.Control)
	BorderThickness	(Inherited from System.Windows.Controls.Control)
	ButtonBackground	Gets or sets the **System.Windows.Media.Brush** that will be assigned to the Background of the buttons inside the control.
	ButtonForeground	Gets or sets the **System.Windows.Media.Brush** that will be assigned to the Foreground of the buttons inside the control.
	CacheMode	(Inherited from System.Windows.UIElement)
	CellsAreaMargin	Gets or sets a **Margin** that can be applied to a **System.Windows.UIElement** locating the element in the area where the cells are shown, typically this margin is applied to the cells panel. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)
	CellsPanel	Gets the cells panel inside this row presenter. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)
	CharacterSpacing	(Inherited from System.Windows.Controls.Control)
	Clip	(Inherited from System.Windows.UIElement)
	Cursor	(Inherited from System.Windows.FrameworkElement)
	DataContext	(Inherited from System.Windows.FrameworkElement)
	DataGrid	Gets the data grid associated with this presenter. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)
	DesiredSize	(Inherited from System.Windows.UIElement)
	Dispatcher	(Inherited from System.Windows.DependencyObject)

	Effect	(Inherited from System.Windows.UIElement)
	FlowDirection	(Inherited from System.Windows.FrameworkElement)
	FontFamily	(Inherited from System.Windows.Controls.Control)
	FontSize	(Inherited from System.Windows.Controls.Control)
	FontStretch	(Inherited from System.Windows.Controls.Control)
	FontStyle	(Inherited from System.Windows.Controls.Control)
	FontWeight	(Inherited from System.Windows.Controls.Control)
	Foreground	(Inherited from System.Windows.Controls.Control)
	GroupContent	Gets or sets the text or uielement displayed as the title of the group
	GroupContentMargin	Gets or sets the margin applied to the group title and collapse/expand checkbox.
	Height	(Inherited from System.Windows.FrameworkElement)
	HorizontalAlignment	(Inherited from System.Windows.FrameworkElement)
	HorizontalContentAlignment	(Inherited from System.Windows.Controls.Control)
	HorizontalGridLineBrush	Gets or sets the **System.Windows.Media.Brush** used to highlight the horizontal grid lines. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)
	HorizontalGridLineOpacity	Gets or sets the opacity of the horizontal grid line. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)
	HorizontalGridLineVisibility	Gets or sets the visibility of the horizontal grid lines of this row, If true, the horizontal grid lines are shown. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)

	IsChecked	Gets or sets whether this group is expanded or collapsed.
	IsEditing	Gets or sets a value indicating whether this cell is currently editing. (Inherited from C1.Silverlight.DataGrid.DataGridSelectableRowPresenter)
	IsEnabled	(Inherited from System.Windows.Controls.Control)
	IsHitTestVisible	(Inherited from System.Windows.UIElement)
	IsMouseOver	Returns true if the mouse is over the control. (Inherited from C1.Silverlight.DataGrid.DataGridSelectableRowPresenter)
	IsSelected	Gets or sets a value indicating whether this cell is currently selected. (Inherited from C1.Silverlight.DataGrid.DataGridSelectableRowPresenter)
	IsTabStop	(Inherited from System.Windows.Controls.Control)
	Item	Gets the DataGridCellPresenter with the specified column. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)
	Language	(Inherited from System.Windows.FrameworkElement)
	Margin	(Inherited from System.Windows.FrameworkElement)
	MaxHeight	(Inherited from System.Windows.FrameworkElement)
	MaxWidth	(Inherited from System.Windows.FrameworkElement)
	MinHeight	(Inherited from System.Windows.FrameworkElement)
	MinWidth	(Inherited from System.Windows.FrameworkElement)
	MouseOverBrush	Gets or sets the **System.Windows.Media.Brush** used to highlight the control when it has the mouse over. (Inherited from

		C1.Silverlight.DataGrid.DataGridSelectableRowPresenter)
	Name	(Inherited from System.Windows.FrameworkElement)
	Opacity	(Inherited from System.Windows.UIElement)
	OpacityMask	(Inherited from System.Windows.UIElement)
	Padding	(Inherited from System.Windows.Controls.Control)
	Parent	(Inherited from System.Windows.FrameworkElement)
	PressedBrush	Gets or sets the **System.Windows.Media.Brush** used to paint a button when it is pressed. (Inherited from C1.Silverlight.DataGrid.DataGridSelectableRowPresenter)
	Projection	(Inherited from System.Windows.UIElement)
	RenderSize	(Inherited from System.Windows.UIElement)
	RenderTransform	(Inherited from System.Windows.UIElement)
	RenderTransformOrigin	(Inherited from System.Windows.UIElement)
	Resources	(Inherited from System.Windows.FrameworkElement)
	Row	Gets the row associated with this presenter. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)
	RowAreaMargin	Gets or sets a **Margin** that can be applied to a **System.Windows.UIElement** inside a row presenter ensuring the element won't be scrolled even whether the row is scrollable. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)
	SelectedBackground	Gets or sets the **System.Windows.Media.Brush** used to highlight the control when it is selected. (Inherited from C1.Silverlight.DataGrid.DataGridSelectableRowPresenter)

	Style	(Inherited from System.Windows.FrameworkElement)
	TabIndex	(Inherited from System.Windows.Controls.Control)
	TabNavigation	(Inherited from System.Windows.Controls.Control)
	Tag	(Inherited from System.Windows.FrameworkElement)
	Template	(Inherited from System.Windows.Controls.Control)
	Triggers	(Inherited from System.Windows.FrameworkElement)
	UseLayoutRounding	(Inherited from System.Windows.UIElement)
	ValidationBackground	Gets or sets the brush used to paint the background of the validation elements. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)
	ValidationResults	Gets or sets a collection of ValidationResult related to the corresponding row. When the number of errors is greater than 0 the background of the row will became red. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)
	ValidationState	Gets or sets the DataGridRowPresenter.ValidationState. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)
	VerticalAlignment	(Inherited from System.Windows.FrameworkElement)
	VerticalContentAlignment	(Inherited from System.Windows.Controls.Control)
	VerticalGridLineBrush	Gets or sets the **System.Windows.Media.Brush** used to highlight the vertical grid lines. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)
	VerticalGridLineVisibility	Gets or sets the visibility of the vertical grid lines of this row, If true, the vertical grid lines are shown. (Inherited from

		C1.Silverlight.DataGrid.DataGridRowPresenter)
	Visibility	(Inherited from System.Windows.UIElement)
	Width	(Inherited from System.Windows.FrameworkElement)

OnApplyTemplate Method

Builds the visual tree for the DataGridGroupRowPresenter control when a new template is applied.

Syntax

Visual Basic (Declaration)

```
Public Overrides Sub OnApplyTemplate()
```

C#

```
public override void OnApplyTemplate()
```

Remarks

This method is invoked whenever application code or an internal process, such as a rebuilding layout pass, calls the **ApplyTemplate** method.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

UseLayoutRounding	(Inherited from System.Windows.UIElement)
ValidationBackground	Gets or sets the brush used to paint the background of the validation elements. (Inherited from

	C1.Silverlight.DataGrid.DataGridRowPresenter)
ValidationResults	Gets or sets a collection of ValidationResult related to the corresponding row. When the number of errors is greater than 0 the background of the row will became red. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)
ValidationState	Gets or sets the DataGridRowPresenter.ValidationState. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)
VerticalAlignment	(Inherited from System.Windows.FrameworkElement)
VerticalContentAlignment	(Inherited from System.Windows.Controls.Control)
VerticalGridLineBrush	Gets or sets the **System.Windows.Media.Brush** used to highlight the vertical grid lines. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)
VerticalGridLineVisibility	Gets or sets the visibility of the vertical grid lines of this row, If true, the vertical grid lines are shown. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)
Visibility	(Inherited from System.Windows.UIElement)
Width	(Inherited from System.Windows.FrameworkElement)

ButtonBackground Property

Gets or sets the **System.Windows.Media.Brush** that will be assigned to the Background of the buttons inside the control.

Syntax

Visual Basic (Declaration)

```
Public Property ButtonBackground As System.Windows.Media.Brush
```

C#

```
public System.Windows.Media.Brush ButtonBackground {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ButtonForeground Property

Gets or sets the **System.Windows.Media.Brush** that will be assigned to the Foreground of the buttons inside the control.

Syntax

Visual Basic (Declaration)
`Public Property ButtonForeground As System.Windows.Media.Brush`
C#
`public System.Windows.Media.Brush ButtonForeground {get; set;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GroupContent Property

Gets or sets the text or uielement displayed as the title of the group

Syntax

Visual Basic (Declaration)

```
Public Property GroupContent As System.Object
```

C#

```
public System.object GroupContent {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GroupContentMargin Property

Gets or sets the margin applied to the group title and collapse/expand checkbox.

Syntax

Visual Basic (Declaration)

```
Public Property GroupContentMargin As System.Windows.Thickness
```

C#

```
public System.Windows.Thickness GroupContentMargin {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CanConvertFrom Method

Returns whether the type converter can convert an object from the specified type to the type of this converter.

Overload List

Overload	Description
CanConvertFrom(ITypeDescriptorContext,Type)	Returns whether the type converter can convert an object from the specified type to the type of this converter.
CanConvertFrom(Type)	(Inherited from System.ComponentModel.TypeConverter)

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

DataGridGroupStateTypeConverter Class
DataGridGroupStateTypeConverter Members

CanConvertFrom(ITypeDescriptorContext,Type) Method
An object that provides a format context.

The type you want to convert from.

Returns whether the type converter can convert an object from the specified type to the type of this converter.

Syntax

Visual Basic (Declaration)

```
Public Overloads Overrides Function CanConvertFrom( _
   ByVal context As System.ComponentModel.ITypeDescriptorContext, _
   ByVal sourceType As System.Type _
) As System.Boolean
```

C#

```
public override System.bool CanConvertFrom(
   System.ComponentModel.ITypeDescriptorContext context,
   System.Type sourceType
)
```

Parameters

context

An object that provides a format context.

sourceType

The type you want to convert from.

Return Value

true if this converter can perform the conversion; otherwise, false.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

Overload List

ConvertFrom Method
Converts from the specified value to the type of this converter.

Overload List

Overload	Description
ConvertFrom(ITypeDescriptorContext,CultureInfo,Object)	Converts from the specified value to the type of this converter.
ConvertFrom(Object)	(Inherited from System.ComponentModel.TypeConverter)

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

DataGridGroupStateTypeConverter Members

ConvertFrom(ITypeDescriptorContext,CultureInfo,Object) Method
An object that provides a format context.

The **System.Globalization.CultureInfo** to use as the current culture.

The value to convert to the type of this converter.

Converts from the specified value to the type of this converter.

Syntax

Visual Basic (Declaration)

```
Public Overloads Overrides Function ConvertFrom( _
   ByVal context As System.ComponentModel.ITypeDescriptorContext, _
   ByVal culture As System.Globalization.CultureInfo, _
   ByVal value As System.Object _
) As System.Object
```

C#

```
public override System.object ConvertFrom(
   System.ComponentModel.ITypeDescriptorContext context,
   System.Globalization.CultureInfo culture,
   System.object value
)
```

Parameters

context

An object that provides a format context.

culture

The **System.Globalization.CultureInfo** to use as the current culture.

value

The value to convert to the type of this converter.

Return Value

The converted value.

Exceptions

Exception	Description
System.NotSupportedException	The conversion cannot be performed.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Top

Public Properties

	Name	Description
	ActualCanUserFilter	Gets a value indicating whether a user can perform a filter operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserGroup	Gets a value indicating whether a user can perform a group operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserResize	(Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserSort	Gets a value indicating whether a user can perform a sort operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualFilterMemberPath	Gets the actual FilterMemberPath. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	ActualGroupHeader	(Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualSortMemberPath	Gets the actual SortMemberPath. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	ActualWidth	Gets the actual width in pixels. (Inherited from

		C1.Silverlight.DataGrid.DataGridColumn)
	AllowNull	Gets or sets a value indicating whether the editing control allows null values. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	Binding	Gets or sets the binding object used to bind the visual element against the data. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	CanUserFilter	Gets or sets a value indicating whether the user can filter by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserGroup	Gets or sets a value indicating whether the user can group by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserMove	Gets or sets a value that indicates whether the user can change the column display order by dragging column headers with the mouse. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserResize	Gets or sets whether the user can resize the column by dragging the border on the right of the column header presenter. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserResizeRows	Gets or sets whether the user can resize the rows manipulating cells in this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserSort	Gets or sets a value indicating whether the user can sort by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CellContentStyle	Gets or sets the style applied to the content of a cell in read mode. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CellEditingContentStyle	Gets or sets the style applied to the content of a cell in edit mode. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

	CellStyle	Gets or sets the style applied to every cell of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ContentTemplate	Gets or sets the content template of the hyperlink.
	DataGrid	Gets the owner data grid. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	DefaultConverter	Overridden. Gets the converter that will be used for each hyperlink.
	Dispatcher	(Inherited from System.Windows.DependencyObject)
	DisplayIndex	Gets or sets the desired index in which the column will be displayed. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	EditOnSelection	Gets or sets a value indicating how the cells enters in edit mode when the user clicks on a cell of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Filter	Gets or sets the filter used in this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	FilterMemberPath	Gets or sets a property name, or a period-delimited hierarchy of property names, that indicates the member to filter by. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	FilterState	Gets the filter state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Format	Gets or sets the format of the content of the cells belonging this column. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	GroupContentConverter	Gets or sets the converter that will be applied to the visual element that is inside the content of each group row. (Inherited

		from C1.Silverlight.DataGrid.DataGridColumn)
	GroupContentStyle	Gets or sets the style applied to the title of each group row related to this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupConverter	Gets or sets the converter used to customize the grouping behavior. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupHeader	Gets or sets the header that will appear in the grouping panel as the column header is dragged there. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupState	Gets the grouping state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Header	Gets or sets the content of the header (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HeaderPresenter	Gets the presenter corresponding to the header of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HeaderStyle	Gets or sets the style of the header. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HorizontalAlignment	Gets or sets the horizontal alignment of the cell content regarding the cell. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HorizontalOffset	Gets the horizontal offset in pixels. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Index	Gets the index of a column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsAutoGenerated	Gets a value that indicates whether the column is auto-generated. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

	IsEditable	Overridden.
	IsFrozen	Gets a value indicating whether this column is moved out of the viewport when the user scrolls the data grid. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsMouseOver	Gets a value indicating whether the mouse is over the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsReadOnly	Gets or sets whether the cells in the column are read only. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsSelectable	Gets or sets a value indicating whether the user is allowed to set the current cell from this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsSelected	Gets a value indicating whether this column is selected. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	MaxWidth	Gets or sets the maximum width of the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	MinWidth	Gets or sets the minimum width of the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Name	Gets or sets the name of the column. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	SortMemberPath	Gets or sets a property name, or a period-delimited hierarchy of property names, that indicates the member to sort by. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	SortState	Gets the sorting state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Tag	Gets or sets the tag. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

	TargetName	Gets or sets the name of the target window or frame that the Web page should open in, or the name of the object within the Silverlight application to navigate to.
	TextTrimming	Gets or sets a value indicating whether the text inside the cell allows trimming. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	TextWrapping	Gets or sets a value indicating whether the text inside the cell allows wrapping. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	VerticalAlignment	Gets or sets the vertical alignment of the cell content regarding the cell. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Visibility	Gets or sets whether the column is visible. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Width	Gets or sets the width of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

DataGridHyperlinkColumn Constructor

Overload List

Overload	Description
DataGridHyperlinkColumn Constructor()	Initializes a new instance of the DataGridHyperlinkColumn class.
DataGridHyperlinkColumn Constructor(PropertyInfo)	Initializes a new instance of the DataGridHyperlinkColumn class.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

DataGridHyperlinkColumn Constructor()

Initializes a new instance of the DataGridHyperlinkColumn class.

Syntax

Visual Basic (Declaration)

```
Public Function New()
```

C#

```
public DataGridHyperlinkColumn()
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Overload List

DataGridHyperlinkColumn Constructor(PropertyInfo)

The property.

Initializes a new instance of the DataGridHyperlinkColumn class.

Syntax

Visual Basic (Declaration)

```
Public Function New( _
   ByVal property As System.Reflection.PropertyInfo _
)
```

C#

```
public DataGridHyperlinkColumn(
   System.Reflection.PropertyInfo property
)
```

Parameters

property

The property.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Properties

>

Name	Description
ActualCanUserFilter	Gets a value indicating whether a user can perform a filter operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
ActualCanUserGroup	Gets a value indicating whether a user can perform a group operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
ActualCanUserResize	(Inherited from C1.Silverlight.DataGrid.DataGridColumn)
ActualCanUserSort	Gets a value indicating whether a user can perform a sort operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
ActualFilterMemberPath	Gets the actual FilterMemberPath. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)

ActualGroupHeader	(Inherited from C1.Silverlight.DataGrid.DataGridColumn)
ActualSortMemberPath	Gets the actual SortMemberPath. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
ActualWidth	Gets the actual width in pixels. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
AllowNull	Gets or sets a value indicating whether the editing control allows null values. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
Binding	Gets or sets the binding object used to bind the visual element against the data. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
CanUserFilter	Gets or sets a value indicating whether the user can filter by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
CanUserGroup	Gets or sets a value indicating whether the user can group by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
CanUserMove	Gets or sets a value that indicates whether the user can change the column display order by dragging column headers with the mouse. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
CanUserResize	Gets or sets whether the user can resize the column by dragging the border on the right of the column header presenter. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
CanUserResizeRows	Gets or sets whether the user can resize the rows manipulating cells in this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
CanUserSort	Gets or sets a value indicating whether the user can sort by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
CellContentStyle	Gets or sets the style applied to the content of a cell in read mode. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
CellEditingContentStyle	Gets or sets the style applied to the content of a cell in edit mode. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
CellStyle	Gets or sets the style applied to every cell of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
ContentTemplate	Gets or sets the content template of the hyperlink.

DataGrid	Gets the owner data grid. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
DefaultConverter	Overridden. Gets the converter that will be used for each hyperlink.
Dispatcher	(Inherited from System.Windows.DependencyObject)
DisplayIndex	Gets or sets the desired index in which the column will be displayed. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
EditOnSelection	Gets or sets a value indicating how the cells enters in edit mode when the user clicks on a cell of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
Filter	Gets or sets the filter used in this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
FilterMemberPath	Gets or sets a property name, or a period-delimited hierarchy of property names, that indicates the member to filter by. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
FilterState	Gets the filter state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
Format	Gets or sets the format of the content of the cells belonging this column. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
GroupContentConverter	Gets or sets the converter that will be applied to the visual element that is inside the content of each group row. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
GroupContentStyle	Gets or sets the style applied to the title of each group row related to this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
GroupConverter	Gets or sets the converter used to customize the grouping behavior. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
GroupHeader	Gets or sets the header that will appear in the grouping panel as the column header is dragged there. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
GroupState	Gets the grouping state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

Header	Gets or sets the content of the header (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
HeaderPresenter	Gets the presenter corresponding to the header of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
HeaderStyle	Gets or sets the style of the header. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
HorizontalAlignment	Gets or sets the horizontal alignment of the cell content regarding the cell. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
HorizontalOffset	Gets the horizontal offset in pixels. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
Index	Gets the index of a column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
IsAutoGenerated	Gets a value that indicates whether the column is auto-generated. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
IsEditable	Overridden.
IsFrozen	Gets a value indicating whether this column is moved out of the viewport when the user scrolls the data grid. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
IsMouseOver	Gets a value indicating whether the mouse is over the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
IsReadOnly	Gets or sets whether the cells in the column are read only. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
IsSelectable	Gets or sets a value indicating whether the user is allowed to set the current cell from this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
IsSelected	Gets a value indicating whether this column is selected. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
MaxWidth	Gets or sets the maximum width of the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
MinWidth	Gets or sets the minimum width of the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
Name	Gets or sets the name of the column. (Inherited from

	C1.Silverlight.DataGrid.DataGridBoundColumn)
SortMemberPath	Gets or sets a property name, or a period-delimited hierarchy of property names, that indicates the member to sort by. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
SortState	Gets the sorting state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
Tag	Gets or sets the tag. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
TargetName	Gets or sets the name of the target window or frame that the Web page should open in, or the name of the object within the Silverlight application to navigate to.
TextTrimming	Gets or sets a value indicating whether the text inside the cell allows trimming. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
TextWrapping	Gets or sets a value indicating whether the text inside the cell allows wrapping. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
VerticalAlignment	Gets or sets the vertical alignment of the cell content regarding the cell. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
Visibility	Gets or sets whether the column is visible. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
Width	Gets or sets the width of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

ContentTemplate Property

Gets or sets the content template of the hyperlink.

Syntax

Visual Basic (Declaration)
`Public Property ContentTemplate As System.Windows.DataTemplate`
C#
`public System.Windows.DataTemplate ContentTemplate {get; set;}`

Property Value

The content template of the hyperlink.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

DefaultConverter Property
Gets the converter that will be used for each hyperlink.

Syntax

Visual Basic (Declaration)
`Public Overrides ReadOnly Property DefaultConverter As System.Windows.Data.IValueConverter`
C#
`public override System.Windows.Data.IValueConverter DefaultConverter {get;}`

Property Value

The default converter.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

TargetName Property

Gets or sets the name of the target window or frame that the Web page should open in, or the name of the object within the Silverlight application to navigate to.

Syntax

Visual Basic (Declaration)
`Public Property TargetName As System.String`
C#
`public System.string TargetName {get; set;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Click Event

Occurs when an hyperlink is clicked.

Syntax

Visual Basic (Declaration)	
`Public Event Click As System.EventHandler(Of DataGridRowEventArgs)`	
C#	
`public event System.EventHandler<DataGridRowEventArgs> Click`	

Event Data

The event handler receives an argument of type DataGridRowEventArgs containing data related to this event. The following **DataGridRowEventArgs** properties provide information specific to this event.

Property	Description
Row	Gets the row.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

	HeaderStyle	Gets or sets the style of the header. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HorizontalAlignment	Gets or sets the horizontal alignment of the cell content regarding the cell. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HorizontalOffset	Gets the horizontal offset in pixels. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ImageNotFoundSource	Gets or sets the default image source for all the rows that aren't bound to a real source. Set null in order to don't show any image by default.
	Index	Gets the index of a column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsAutoGenerated	Gets a value that indicates whether the column is auto-generated. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsEditable	Overridden.
	IsFrozen	Gets a value indicating whether this column is moved out of the viewport when the user scrolls the data grid. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsMouseOver	Gets a value indicating whether the mouse is over the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsReadOnly	Gets or sets whether the cells in the column are read only. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

	IsSelectable	Gets or sets a value indicating whether the user is allowed to set the current cell from this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsSelected	Gets a value indicating whether this column is selected. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	MaxWidth	Gets or sets the maximum width of the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	MinWidth	Gets or sets the minimum width of the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Name	Gets or sets the name of the column. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	SortMemberPath	Gets or sets a property name, or a period-delimited hierarchy of property names, that indicates the member to sort by. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	SortState	Gets the sorting state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Stretch	Gets or sets a value that describes how an Image should be stretched to fill the destination rectangle.
	Tag	Gets or sets the tag. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	TextTrimming	Gets or sets a value indicating whether the text inside the cell allows trimming. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	TextWrapping	Gets or sets a value indicating whether the text inside the cell allows wrapping. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)

	VerticalAlignment	Gets or sets the vertical alignment of the cell content regarding the cell. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Visibility	Gets or sets whether the column is visible. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Width	Gets or sets the width of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

DataGridImageColumn Constructor

Overload List

Overload	Description
DataGridImageColumn Constructor()	Initializes a new instance of a DataGridImageColumn.
DataGridImageColumn Constructor(PropertyInfo)	Initializes a new instance of the DataGridImageColumn class.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

DataGridImageColumn Constructor(PropertyInfo)

The property info used to initialize the column.

Initializes a new instance of the DataGridImageColumn class.

Syntax

Visual Basic (Declaration)

`Public Function New( _`
`   ByVal property As System.Reflection.PropertyInfo _`
`)`

C#

`public DataGridImageColumn(`
`   System.Reflection.PropertyInfo property`
`)`

Parameters

property

The property info used to initialize the column.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CreateCellContent Method

Gets an **System.Windows.Controls.Image** that will be used to display the image into a cell of this column.

Syntax

Visual Basic (Declaration)

```
Public Overrides Function CreateCellContent( _
   ByVal row As DataGridRow _
) As System.Windows.FrameworkElement
```

C#

```
public override System.Windows.FrameworkElement CreateCellContent(
   DataGridRow row
)
```

Parameters

row

Return Value

Image that represent the cell content.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Public Properties

	Name	Description
	ActualCanUserFilter	Gets a value indicating whether a user can perform a filter operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserGroup	Gets a value indicating whether a user can perform a group operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserResize	(Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserSort	Gets a value indicating whether a user can perform a sort operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualFilterMemberPath	Gets the actual FilterMemberPath. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	ActualGroupHeader	(Inherited from C1.Silverlight.DataGrid.DataGridColumn)

	ActualSortMemberPath	Gets the actual SortMemberPath. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	ActualWidth	Gets the actual width in pixels. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	AllowNull	Gets or sets a value indicating whether the editing control allows null values. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	Binding	Gets or sets the binding object used to bind the visual element against the data. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	CanUserFilter	Gets or sets a value indicating whether the user can filter by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserGroup	Gets or sets a value indicating whether the user can group by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserMove	Gets or sets a value that indicates whether the user can change the column display order by dragging column headers with the mouse. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserResize	Gets or sets whether the user can resize the column by dragging the border on the right of the column header presenter. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserResizeRows	Gets or sets whether the user can resize the rows manipulating cells in this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserSort	Gets or sets a value indicating whether the user can sort by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CellContentStyle	Gets or sets the style applied to the content of a cell in read mode. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

	CellEditingContentStyle	Gets or sets the style applied to the content of a cell in edit mode. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CellStyle	Gets or sets the style applied to every cell of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	DataGrid	Gets the owner data grid. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	DefaultConverter	Overridden.
	Dispatcher	(Inherited from System.Windows.DependencyObject)
	DisplayIndex	Gets or sets the desired index in which the column will be displayed. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	EditOnSelection	Gets or sets a value indicating how the cells enters in edit mode when the user clicks on a cell of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Filter	Gets or sets the filter used in this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	FilterMemberPath	Gets or sets a property name, or a period-delimited hierarchy of property names, that indicates the member to filter by. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	FilterState	Gets the filter state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Format	Gets or sets the format of the content of the cells belonging this column. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	GroupContentConverter	Gets or sets the converter that will be applied to the visual element that is inside the content of each group row. (Inherited

		from C1.Silverlight.DataGrid.DataGridColumn)
	GroupContentStyle	Gets or sets the style applied to the title of each group row related to this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupConverter	Gets or sets the converter used to customize the grouping behavior. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupHeader	Gets or sets the header that will appear in the grouping panel as the column header is dragged there. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupState	Gets the grouping state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Header	Gets or sets the content of the header (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HeaderPresenter	Gets the presenter corresponding to the header of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HeaderStyle	Gets or sets the style of the header. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HorizontalAlignment	Gets or sets the horizontal alignment of the cell content regarding the cell. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HorizontalOffset	Gets the horizontal offset in pixels. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ImageNotFoundSource	Gets or sets the default image source for all the rows that aren't bound to a real source. Set null in order to don't show any image by default.
	Index	Gets the index of a column. (Inherited from

		C1.Silverlight.DataGrid.DataGridColumn)
	IsAutoGenerated	Gets a value that indicates whether the column is auto-generated. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsEditable	Overridden.
	IsFrozen	Gets a value indicating whether this column is moved out of the viewport when the user scrolls the data grid. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsMouseOver	Gets a value indicating whether the mouse is over the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsReadOnly	Gets or sets whether the cells in the column are read only. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsSelectable	Gets or sets a value indicating whether the user is allowed to set the current cell from this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsSelected	Gets a value indicating whether this column is selected. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	MaxWidth	Gets or sets the maximum width of the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	MinWidth	Gets or sets the minimum width of the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Name	Gets or sets the name of the column. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	SortMemberPath	Gets or sets a property name, or a period-delimited hierarchy of property names, that indicates the member to sort by. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

	SortState	Gets the sorting state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Stretch	Gets or sets a value that describes how an Image should be stretched to fill the destination rectangle.
	Tag	Gets or sets the tag. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	TextTrimming	Gets or sets a value indicating whether the text inside the cell allows trimming. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	TextWrapping	Gets or sets a value indicating whether the text inside the cell allows wrapping. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	VerticalAlignment	Gets or sets the vertical alignment of the cell content regarding the cell. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Visibility	Gets or sets whether the column is visible. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Width	Gets or sets the width of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

DefaultConverter Property

Syntax

Visual Basic (Declaration)	

```
Public Overrides ReadOnly Property DefaultConverter As
System.Windows.Data.IValueConverter
```

C#

```
public override System.Windows.Data.IValueConverter DefaultConverter {get;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ImageNotFoundSource Property

Gets or sets the default image source for all the rows that aren't bound to a real source. Set null in order to don't show any image by default.

Syntax

Visual Basic (Declaration)

```
Public Overridable Property ImageNotFoundSource As
System.Windows.Media.ImageSource
```

C#

```
public virtual System.Windows.Media.ImageSource ImageNotFoundSource {get;
set;}
```

Property Value

The default image source.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CanConvertFrom(ITypeDescriptorContext,Type) Method
An object that provides a format context.

The type you want to convert from.

Returns whether the type converter can convert an object from the specified type to the type of this converter.

Syntax

Visual Basic (Declaration)

```
Public Overloads Overrides Function CanConvertFrom( _
   ByVal context As System.ComponentModel.ITypeDescriptorContext, _
   ByVal sourceType As System.Type _
) As System.Boolean
```

C#

```
public override System.bool CanConvertFrom(
```

```
   System.ComponentModel.ITypeDescriptorContext context,
   System.Type sourceType
)
```

Parameters

context

An object that provides a format context.

sourceType

The type you want to convert from.

Return Value

true if this converter can perform the conversion; otherwise, false.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

DataGridLengthTypeConverter Class
DataGridLengthTypeConverter Members

ConvertFrom(ITypeDescriptorContext,CultureInfo,Object) Method
An object that provides a format context.

The **System.Globalization.CultureInfo** to use as the current culture.

The value to convert to the type of this converter.

Converts from the specified value to the intended conversion type of the converter.

Syntax

Visual Basic (Declaration)

```
Public Overloads Overrides Function ConvertFrom( _
   ByVal context As System.ComponentModel.ITypeDescriptorContext, _
   ByVal culture As System.Globalization.CultureInfo, _
   ByVal value As System.Object _
) As System.Object
```

C#

```
public override System.object ConvertFrom(
   System.ComponentModel.ITypeDescriptorContext context,
   System.Globalization.CultureInfo culture,
   System.object value
)
```

Parameters

context

An object that provides a format context.

culture

The **System.Globalization.CultureInfo** to use as the current culture.

value

The value to convert to the type of this converter.

Return Value

The converted value.

Exceptions

Exception	Description
System.NotImplementedException	**System.ComponentModel.TypeConverter.ConvertFrom(S** not implemented in base **System.ComponentModel.TypeC**

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Clear Method

Clears the current filter criteria and the values contained in the filter control.

Syntax

Visual Basic (Declaration)
`Public Sub Clear()`
C#
`public void Clear()`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

DataGridMultiValueFilter Class

Create Method

Creates the filter based on the current filter criteria set by the user in the filter control. Raises the FilterChanged event if necessary.

Syntax

Visual Basic (Declaration)
`Public Sub Create()`
C#
`public void Create()`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

DataGridMultiValueFilter Class

Load Method

the desired state.

Initializes the filter and filter control to the desired state.

Syntax

Visual Basic (Declaration)

```
Public Sub Load( _
   ByVal filterState As DataGridFilterState _
)
```

C#

```
public void Load(
   DataGridFilterState filterState
)
```

Parameters

filterState

the desired state.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

OnApplyTemplate Method

Builds the visual tree for the DataGridMultiValueFilter control when a new template is applied.

Syntax

Visual Basic (Declaration)

```
Public Overrides Sub OnApplyTemplate()
```

C#

```
public override void OnApplyTemplate()
```

Remarks

This method is invoked whenever application code or an internal process, such as a rebuilding layout pass, calls the **ApplyTemplate** method.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

SetIsVirtualizing Method

if set to `true` it will use a virtualizing stack panel.

Sets whether this control will use a virtualizing stack panel or not.

Syntax

Visual Basic (Declaration)

`Public Sub SetIsVirtualizing( _`
`   ByVal isVirtualized As System.Boolean _`
`)`

C#

`public void SetIsVirtualizing(`
`   System.bool isVirtualized`
`)`

Parameters

isVirtualized

if set to `true` it will use a virtualizing stack panel.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ValueMemberPath Property

Gets or sets the name of the property or path of the items set in ItemsSource in order to filter by the value contained in that property.

Syntax

Visual Basic (Declaration)

```
Public Property ValueMemberPath As System.String
```

C#

```
public System.string ValueMemberPath {get; set;}
```

Property Value

The value member path.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

FilterChanged Event

Occurs when the filter criteria changes.

Syntax

Visual Basic (Declaration)	
`Public Event FilterChanged As System.EventHandler(Of PropertyChangedEventArgs(Of DataGridFilterState))`	
C#	
`public event System.EventHandler<PropertyChangedEventArgs<DataGridFilterState>> FilterChanged`	

Event Data

The event handler receives an argument of type C1.Silverlight.PropertyChangedEventArgs<T> containing data related to this event. The following **PropertyChangedEventArgs<T>** properties provide information specific to this event.

Property	Description
NewValue	
OldValue	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Properties Methods Events

The following tables list the members exposed by DataGridNewRow.

Public Constructors

	Name	Description
	DataGridNewRow Constructor	

Top

Public Properties

	Name	Description
	ActualCanUserToggleDetails	Gets or sets a value indicating whether the user can toggle details, taking in consideration properties of the containing DataGrid. (Inherited from

		C1.Silverlight.DataGrid.DataGridRow)
	ActualDetailsVisibility	Gets a value indicating whether this row is showing details, taking in consideration properties of the containing DataGrid. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	ActualHeight	Gets the actual height in pixels. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	ActualHeightWithoutDetails	Gets the actual height in pixels (without the details). (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	CanUserResize	Gets or sets a value indicating whether this row can be resized by the user. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	CanUserToggleDetails	Gets or sets a value indicating whether the user can toggle details. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	CellStyle	Gets or sets the style applied to all the cells of this row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	DataGrid	Gets the data grid to which the row belongs. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	DataItem	Gets the data of the row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	DetailsPresenter	Gets the visual element that will be arranged at the bottom of the row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	DetailsVisibility	Gets or sets a value indicating whether this row is showing details. (Inherited from C1.Silverlight.DataGrid.DataGridRow)

	Dispatcher	(Inherited from System.Windows.DependencyObject)
	Errors	Gets the collection of errors associated with this row. Add errors here if you want to display an error message in the corresponding row header. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	HeaderPresenter	Gets the visual element that represent the header of this row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	Height	Gets or sets the height of this row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	IndentWidth	Gets the distance between the row header and the first cell of the row. This empty space is only present when there are groups in the data grid. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	Index	Gets the index of the row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	IsEditable	Gets a value indicating whether this row is editable. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	IsEditing	Gets or sets a value indicating whether this row is editing. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	IsEnteringNewRow	Gets a value indicating whether this instance is entering a new row.
	IsMouseOver	Gets a value indicating whether the mouse is over the row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	IsSelectable	Gets or sets a value indicating whether the user is allowed to set the current cell from this row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)

	IsSelected	Gets a value indicating whether this row is selected. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	Level	Gets the grouping level of this row. This info will be used to indent the row if the grid data is grouped. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	MaxHeight	Gets or sets the maximum height (in pixels) allowed. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	MinHeight	Gets or sets the minimum height (in pixels) allowed. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	ParentCollection	Gets the collection of rows to which this row belongs. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	ParentGroup	Gets the parent group. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	Presenter	Gets the visual element that represent this row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	RowHeaderStyle	Gets or sets the style applied to the row header presenter of this row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	RowStyle	Gets or sets the style of the row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	ShowVerticalFreezingSeparator	Gets a value indicating whether to show vertical freezing separator. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	Type	Gets the type of row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	ValidationResults	Gets the collection of errors associated with this row. Add errors here if you want to display an error message in the

		corresponding row header. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	VerticalOffset	Gets the vertical offset in pixels. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	Visibility	Gets or sets the visibility of the row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)

Top

Public Methods

	Name	Description
	ClearValue	(Inherited from System.Windows.DependencyObject)
	GetAnimationBaseValue	(Inherited from System.Windows.DependencyObject)
	GetCellPresenter	(Inherited from C1.Silverlight.DataGrid.DataGridRow)
	GetValue	(Inherited from System.Windows.DependencyObject)
	ReadLocalValue	(Inherited from System.Windows.DependencyObject)
	Refresh	Unload every visual element which is related to the row. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	SetValue	(Inherited from System.Windows.DependencyObject)
	ToString	Returns a **System.String** that represents the current **System.Object**. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	Validate	Overloaded. Validates the DataGridRow.DataItem. Implement IDataErrorInfo or INotifyDataErrorInfo in order to implement your own validation rules. (Inherited from C1.Silverlight.DataGrid.DataGridRow)

Top

Public Events

	Name	Description
	CanUserResizeChanged	Occurs after the DataGridRow.CanUserResize value changed. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	CanUserToggleDetailsChanged	Occurs after the DataGridRow.CanUserToggleDetails value changed. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	DetailsVisibilityChanged	Occurs after the visibility of the details of the row changed. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	HeightChanged	Occurs after the height was changed. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	IsEditingChanged	Occurs when the IsEditing value changed. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	IsEnteringNewRowChanged	Occurs when is entering a new row.
	IsEnteringNewRowChanging	Occurs before is entering changed.
	Loaded	Occurs after the row is added to the collection of rows. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	PropertyChanged	Occurs when a property value changes. (Inherited from C1.Silverlight.DataGrid.DataGridRow)
	VisibilityChanged	Occurs after the visibility of the row changed. (Inherited from C1.Silverlight.DataGrid.DataGridRow)

IsEnteringNewRow Property

Gets a value indicating whether this instance is entering a new row.

Syntax

Visual Basic (Declaration)
`Public ReadOnly Property IsEnteringNewRow As System.Boolean`
C#
`public System.bool IsEnteringNewRow {get;}`

Property Value

`true` if this instance is entering new row; otherwise, `false`.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IsEnteringNewRowChanged Event

Occurs when is entering a new row.

Syntax

Visual Basic (Declaration)
`Public Event IsEnteringNewRowChanged As System.EventHandler(Of PropertyChangedEventArgs(Of Boolean))`
C#
`public event System.EventHandler<PropertyChangedEventArgs<bool>> IsEnteringNewRowChanged`

Event Data

The event handler receives an argument of type C1.Silverlight.PropertyChangedEventArgs<T> containing data related to this event. The following **PropertyChangedEventArgs<T>** properties provide information specific to this event.

Property	Description
NewValue	
OldValue	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

	CacheMode	(Inherited from System.Windows.UIElement)
	CanUserResize	Gets or sets a value indicating whether the user can adjust row height by dragging the bottom edge of the row header. (Inherited from C1.Silverlight.DataGrid.DataGridRowHeaderPresenter)
	CanUserToggleDetails	Gets or sets a value indicating whether the expand/collapse button is visible. (Inherited from C1.Silverlight.DataGrid.DataGridRowHeaderPresenter)
	CharacterSpacing	(Inherited from System.Windows.Controls.Control)
	Clip	(Inherited from System.Windows.UIElement)
	Content	(Inherited from System.Windows.Controls.ContentControl)
	ContentTemplate	(Inherited from System.Windows.Controls.ContentControl)
	Cursor	(Inherited from System.Windows.FrameworkElement)
	DataContext	(Inherited from System.Windows.FrameworkElement)

	DataGrid	Gets the owner data grid. (Inherited from C1.Silverlight.DataGrid.DataGridRowHeaderPresenter)
	DesiredSize	(Inherited from System.Windows.UIElement)
	DetailsVisibility	Gets or sets the visibility of the details. (Inherited from C1.Silverlight.DataGrid.DataGridRowHeaderPresenter)
	Dispatcher	(Inherited from System.Windows.DependencyObject)
	Effect	(Inherited from System.Windows.UIElement)
	FlowDirection	(Inherited from System.Windows.FrameworkElement)
	FontFamily	(Inherited from System.Windows.Controls.Control)
	FontSize	(Inherited from System.Windows.Controls.Control)
	FontStretch	(Inherited from System.Windows.Controls.Control)
	FontStyle	(Inherited from System.Windows.Controls.Control)
	FontWeight	(Inherited from System.Windows.Controls.Control)
	Foreground	(Inherited from System.Windows.Controls.Control)
	Height	(Inherited from System.Windows.FrameworkElement)
	HorizontalAlignment	(Inherited from System.Windows.FrameworkElement)
	HorizontalContentAlignment	(Inherited from System.Windows.Controls.Control)
	IsEditing	Gets or sets a value indicating whether the row is currently being edited. (Inherited from C1.Silverlight.DataGrid.DataGridRowHeaderPresenter)
	IsEnabled	(Inherited from System.Windows.Controls.Control)

	IsHitTestVisible	(Inherited from System.Windows.UIElement)
	IsMerging	Gets or sets a value indicating whether the header may get merged. (Inherited from C1.Silverlight.DataGrid.DataGridRowHeaderPresenter)
	IsMouseOver	Returns true if the mouse is over the control. (Inherited from C1.Silverlight.DataGrid.DataGridRowHeaderPresenter)
	IsSelected	Gets or sets a value indicating whether the row is currently selected or not. (Inherited from C1.Silverlight.DataGrid.DataGridRowHeaderPresenter)
	IsTabStop	(Inherited from System.Windows.Controls.Control)
	Language	(Inherited from System.Windows.FrameworkElement)
	Margin	(Inherited from System.Windows.FrameworkElement)
	MaxHeight	(Inherited from System.Windows.FrameworkElement)
	MaxWidth	(Inherited from System.Windows.FrameworkElement)
	MinHeight	(Inherited from System.Windows.FrameworkElement)
	MinWidth	(Inherited from System.Windows.FrameworkElement)
	MouseOverBrush	Gets or sets the **System.Windows.Media.Brush** used to highlight the control when it has the mouse over. (Inherited from C1.Silverlight.DataGrid.DataGridRowHeaderPresenter)
	Name	(Inherited from System.Windows.FrameworkElement)
	Opacity	(Inherited from System.Windows.UIElement)
	OpacityMask	(Inherited from System.Windows.UIElement)
	Padding	(Inherited from System.Windows.Controls.Control)

	Parent	(Inherited from System.Windows.FrameworkElement)
	PressedBrush	Gets or sets the **System.Windows.Media.Brush** used to paint a button when it is pressed. (Inherited from C1.Silverlight.DataGrid.DataGridRowHeaderPresenter)
	Projection	(Inherited from System.Windows.UIElement)
	RenderSize	(Inherited from System.Windows.UIElement)
	RenderTransform	(Inherited from System.Windows.UIElement)
	RenderTransformOrigin	(Inherited from System.Windows.UIElement)
	Resources	(Inherited from System.Windows.FrameworkElement)
	Row	Gets the owner row. (Inherited from C1.Silverlight.DataGrid.DataGridRowHeaderPresenter)
	SelectedBackground	Gets or sets the **System.Windows.Media.Brush** used to highlight the control when it is selected. (Inherited from C1.Silverlight.DataGrid.DataGridRowHeaderPresenter)
	Style	(Inherited from System.Windows.FrameworkElement)
	TabIndex	(Inherited from System.Windows.Controls.Control)
	TabNavigation	(Inherited from System.Windows.Controls.Control)
	Tag	(Inherited from System.Windows.FrameworkElement)
	Template	(Inherited from System.Windows.Controls.Control)
	Triggers	(Inherited from System.Windows.FrameworkElement)
	UseLayoutRounding	(Inherited from System.Windows.UIElement)
	ValidationBackground	Gets or sets the brush used to paint the background of the

		validation elements. (Inherited from C1.Silverlight.DataGrid.DataGridRowHeaderPresenter)
	ValidationForeground	Gets or sets the brush used to paint the foreground of the validation elements. (Inherited from C1.Silverlight.DataGrid.DataGridRowHeaderPresenter)
	ValidationResults	Gets or sets a collection of ValidationResult related to the corresponding row. This errors will be displayed as red icon whit a tooltip showing the text of the error. (Inherited from C1.Silverlight.DataGrid.DataGridRowHeaderPresenter)
	ValidationState	Gets or sets the DataGridRowHeaderPresenter.ValidationState of the related row. (Inherited from C1.Silverlight.DataGrid.DataGridRowHeaderPresenter)
	VerticalAlignment	(Inherited from System.Windows.FrameworkElement)
	VerticalContentAlignment	(Inherited from System.Windows.Controls.Control)
	Visibility	(Inherited from System.Windows.UIElement)
	Width	(Inherited from System.Windows.FrameworkElement)

	Height	(Inherited from System.Windows.FrameworkElement)
	HorizontalAlignment	(Inherited from System.Windows.FrameworkElement)
	HorizontalContentAlignment	(Inherited from System.Windows.Controls.Control)
	HorizontalGridLineBrush	Gets or sets the **System.Windows.Media.Brush** used to highlight the horizontal grid lines. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)
	HorizontalGridLineOpacity	Gets or sets the opacity of the horizontal grid line. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)
	HorizontalGridLineVisibility	Gets or sets the visibility of the horizontal grid lines of this row, If true, the horizontal grid lines are shown. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)
	IsEditing	Gets or sets a value indicating whether this cell is currently editing. (Inherited from C1.Silverlight.DataGrid.DataGridSelectableRowPresenter)
	IsEnabled	(Inherited from System.Windows.Controls.Control)
	IsHitTestVisible	(Inherited from System.Windows.UIElement)
	IsMouseOver	Returns true if the mouse is over the control. (Inherited from C1.Silverlight.DataGrid.DataGridSelectableRowPresenter)
	IsSelected	Gets or sets a value indicating whether this cell is currently selected. (Inherited from C1.Silverlight.DataGrid.DataGridSelectableRowPresenter)
	IsTabStop	(Inherited from System.Windows.Controls.Control)
	Item	Gets the DataGridCellPresenter with the specified column. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)

	Language	(Inherited from System.Windows.FrameworkElement)
	Margin	(Inherited from System.Windows.FrameworkElement)
	MaxHeight	(Inherited from System.Windows.FrameworkElement)
	MaxWidth	(Inherited from System.Windows.FrameworkElement)
	MinHeight	(Inherited from System.Windows.FrameworkElement)
	MinWidth	(Inherited from System.Windows.FrameworkElement)
	MouseOverBrush	Gets or sets the **System.Windows.Media.Brush** used to highlight the control when it has the mouse over. (Inherited from C1.Silverlight.DataGrid.DataGridSelectableRowPresenter)
	Name	(Inherited from System.Windows.FrameworkElement)
	Opacity	(Inherited from System.Windows.UIElement)
	OpacityMask	(Inherited from System.Windows.UIElement)
	Padding	(Inherited from System.Windows.Controls.Control)
	Parent	(Inherited from System.Windows.FrameworkElement)
	PressedBrush	Gets or sets the **System.Windows.Media.Brush** used to paint a button when it is pressed. (Inherited from C1.Silverlight.DataGrid.DataGridSelectableRowPresenter)
	Projection	(Inherited from System.Windows.UIElement)
	RenderSize	(Inherited from System.Windows.UIElement)
	RenderTransform	(Inherited from System.Windows.UIElement)
	RenderTransformOrigin	(Inherited from System.Windows.UIElement)

	Resources	(Inherited from System.Windows.FrameworkElement)
	Row	Gets the row associated with this presenter. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)
	RowAreaMargin	Gets or sets a **Margin** that can be applied to a **System.Windows.UIElement** inside a row presenter ensuring the element won't be scrolled even whether the row is scrollable. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)
	SelectedBackground	Gets or sets the **System.Windows.Media.Brush** used to highlight the control when it is selected. (Inherited from C1.Silverlight.DataGrid.DataGridSelectableRowPresenter)
	Style	(Inherited from System.Windows.FrameworkElement)
	TabIndex	(Inherited from System.Windows.Controls.Control)
	TabNavigation	(Inherited from System.Windows.Controls.Control)
	Tag	(Inherited from System.Windows.FrameworkElement)
	Template	(Inherited from System.Windows.Controls.Control)
	Triggers	(Inherited from System.Windows.FrameworkElement)
	UseLayoutRounding	(Inherited from System.Windows.UIElement)
	ValidationBackground	Gets or sets the brush used to paint the background of the validation elements. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)
	ValidationResults	Gets or sets a collection of ValidationResult related to the corresponding row. When the number of errors is greater than 0 the background of the row will became red. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)

	ValidationState	Gets or sets the DataGridRowPresenter.ValidationState. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)
	VerticalAlignment	(Inherited from System.Windows.FrameworkElement)
	VerticalContentAlignment	(Inherited from System.Windows.Controls.Control)
	VerticalGridLineBrush	Gets or sets the **System.Windows.Media.Brush** used to highlight the vertical grid lines. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)
	VerticalGridLineVisibility	Gets or sets the visibility of the vertical grid lines of this row, If true, the vertical grid lines are shown. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)
	Visibility	(Inherited from System.Windows.UIElement)
	WatermarkText	Gets or sets that is shown in the whole row before the data is entered.
	Width	(Inherited from System.Windows.FrameworkElement)

OnApplyTemplate Method

Builds the visual tree for the DataGridNewRowPresenter control when a new template is applied.

Syntax

Visual Basic (Declaration)
`Public Overrides Sub OnApplyTemplate()`
C#
`public override void OnApplyTemplate()`

Remarks

This method is invoked whenever application code or an internal process, such as a rebuilding layout pass, calls the **ApplyTemplate** method.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IsEnabled	(Inherited from System.Windows.Controls.Control)
IsHitTestVisible	(Inherited from System.Windows.UIElement)
IsMouseOver	Returns true if the mouse is over the control. (Inherited from C1.Silverlight.DataGrid.DataGridSelectableRowPresenter)
IsSelected	Gets or sets a value indicating whether this cell is currently selected. (Inherited from C1.Silverlight.DataGrid.DataGridSelectableRowPresenter)
IsTabStop	(Inherited from System.Windows.Controls.Control)
Item	Gets the DataGridCellPresenter with the specified column. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)
Language	(Inherited from System.Windows.FrameworkElement)
Margin	(Inherited from System.Windows.FrameworkElement)
MaxHeight	(Inherited from System.Windows.FrameworkElement)
MaxWidth	(Inherited from System.Windows.FrameworkElement)
MinHeight	(Inherited from System.Windows.FrameworkElement)
MinWidth	(Inherited from System.Windows.FrameworkElement)
MouseOverBrush	Gets or sets the **System.Windows.Media.Brush** used to highlight the control when it has the mouse over. (Inherited

	from C1.Silverlight.DataGrid.DataGridSelectableRowPresenter)
Name	(Inherited from System.Windows.FrameworkElement)
Opacity	(Inherited from System.Windows.UIElement)
OpacityMask	(Inherited from System.Windows.UIElement)
Padding	(Inherited from System.Windows.Controls.Control)
Parent	(Inherited from System.Windows.FrameworkElement)
PressedBrush	Gets or sets the **System.Windows.Media.Brush** used to paint a button when it is pressed. (Inherited from C1.Silverlight.DataGrid.DataGridSelectableRowPresenter)
Projection	(Inherited from System.Windows.UIElement)
RenderSize	(Inherited from System.Windows.UIElement)
RenderTransform	(Inherited from System.Windows.UIElement)
RenderTransformOrigin	(Inherited from System.Windows.UIElement)
Resources	(Inherited from System.Windows.FrameworkElement)
Row	Gets the row associated with this presenter. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)
RowAreaMargin	Gets or sets a **Margin** that can be applied to a **System.Windows.UIElement** inside a row presenter ensuring the element won't be scrolled even whether the row is scrollable. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)
SelectedBackground	Gets or sets the **System.Windows.Media.Brush** used to highlight the control when it is selected. (Inherited from C1.Silverlight.DataGrid.DataGridSelectableRowPresenter)
Style	(Inherited from System.Windows.FrameworkElement)
TabIndex	(Inherited from System.Windows.Controls.Control)
TabNavigation	(Inherited from System.Windows.Controls.Control)
Tag	(Inherited from System.Windows.FrameworkElement)

Template	(Inherited from System.Windows.Controls.Control)
Triggers	(Inherited from System.Windows.FrameworkElement)
UseLayoutRounding	(Inherited from System.Windows.UIElement)
ValidationBackground	Gets or sets the brush used to paint the background of the validation elements. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)
ValidationResults	Gets or sets a collection of ValidationResult related to the corresponding row. When the number of errors is greater than 0 the background of the row will became red. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)
ValidationState	Gets or sets the DataGridRowPresenter.ValidationState. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)
VerticalAlignment	(Inherited from System.Windows.FrameworkElement)
VerticalContentAlignment	(Inherited from System.Windows.Controls.Control)
VerticalGridLineBrush	Gets or sets the **System.Windows.Media.Brush** used to highlight the vertical grid lines. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)
VerticalGridLineVisibility	Gets or sets the visibility of the vertical grid lines of this row, If true, the vertical grid lines are shown. (Inherited from C1.Silverlight.DataGrid.DataGridRowPresenter)
Visibility	(Inherited from System.Windows.UIElement)
WatermarkText	Gets or sets that is shown in the whole row before the data is entered.
Width	(Inherited from System.Windows.FrameworkElement)

WatermarkText Property

Gets or sets that is shown in the whole row before the data is entered.

Syntax

Visual Basic (Declaration)
`Public Property WatermarkText As System.String`
C#
`public System.string WatermarkText {get; set;}`

Remarks

Default value is "Click here to enter a new row".

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Public Properties

	Name	Description
	ActualCanUserFilter	Gets a value indicating whether a user can perform a filter operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserGroup	Gets a value indicating whether a user can perform a group operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserResize	(Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserSort	Gets a value indicating whether a user can perform a sort operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualFilterMemberPath	Gets the actual FilterMemberPath. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	ActualGroupHeader	(Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualSortMemberPath	Gets the actual SortMemberPath. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	ActualWidth	Gets the actual width in pixels. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	AllowNull	Gets or sets a value indicating whether the editing control allows null values. (Inherited from

		C1.Silverlight.DataGrid.DataGridBoundColumn)
	Binding	Gets or sets the binding object used to bind the visual element against the data. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	CanUserFilter	Gets or sets a value indicating whether the user can filter by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserGroup	Gets or sets a value indicating whether the user can group by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserMove	Gets or sets a value that indicates whether the user can change the column display order by dragging column headers with the mouse. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserResize	Gets or sets whether the user can resize the column by dragging the border on the right of the column header presenter. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserResizeRows	Gets or sets whether the user can resize the rows manipulating cells in this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserSort	Gets or sets a value indicating whether the user can sort by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CellContentStyle	Gets or sets the style applied to the content of a cell in read mode. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CellEditingContentStyle	Gets or sets the style applied to the content of a cell in edit mode. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CellStyle	Gets or sets the style applied to every cell of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	DataGrid	Gets the owner data grid. (Inherited from

		C1.Silverlight.DataGrid.DataGridColumn)
	DefaultConverter	Overridden.
	Dispatcher	(Inherited from System.Windows.DependencyObject)
	DisplayIndex	Gets or sets the desired index in which the column will be displayed. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	EditOnSelection	Gets or sets a value indicating how the cells enters in edit mode when the user clicks on a cell of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Filter	Gets or sets the filter used in this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	FilterMemberPath	Gets or sets a property name, or a period-delimited hierarchy of property names, that indicates the member to filter by. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	FilterState	Gets the filter state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Format	Gets or sets the format of the content of the cells belonging this column. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	GroupContentConverter	Gets or sets the converter that will be applied to the visual element that is inside the content of each group row. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupContentStyle	Gets or sets the style applied to the title of each group row related to this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupConverter	Gets or sets the converter used to customize the grouping

		behavior. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupHeader	Gets or sets the header that will appear in the grouping panel as the column header is dragged there. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupState	Gets the grouping state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HandleUpDownKeys	Gets or sets a value indicating whether handle up and down keys.
	Header	Gets or sets the content of the header (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HeaderPresenter	Gets the presenter corresponding to the header of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HeaderStyle	Gets or sets the style of the header. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HorizontalAlignment	Gets or sets the horizontal alignment of the cell content regarding the cell. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HorizontalOffset	Gets the horizontal offset in pixels. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Index	Gets the index of a column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsAutoGenerated	Gets a value that indicates whether the column is auto-generated. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsEditable	(Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	IsFrozen	Gets a value indicating whether this column is moved out of the viewport when the user scrolls the data grid. (Inherited from

		C1.Silverlight.DataGrid.DataGridColumn)
	IsMouseOver	Gets a value indicating whether the mouse is over the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsReadOnly	Gets or sets whether the cells in the column are read only. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsSelectable	Gets or sets a value indicating whether the user is allowed to set the current cell from this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsSelected	Gets a value indicating whether this column is selected. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Maximum	Gets or sets the maximum value allowed for the **C1.Silverlight.C1NumericBox**.
	MaxWidth	Gets or sets the maximum width of the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Minimum	Gets or sets the minimum value allowed for the **C1.Silverlight.C1NumericBox**.
	MinWidth	Gets or sets the minimum width of the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Name	Gets or sets the name of the column. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	RangeValidationMode	Gets or sets the mode used to validate the range between Minimum and Maximum.
	ShowButtons	Shows or hides the buttons for Increment or Decrement.
	SortMemberPath	Gets or sets a property name, or a period-delimited hierarchy of property names, that indicates the member to sort by. (Inherited

		from C1.Silverlight.DataGrid.DataGridColumn)
	SortState	Gets the sorting state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Tag	Gets or sets the tag. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	TextTrimming	Gets or sets a value indicating whether the text inside the cell allows trimming. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	TextWrapping	Gets or sets a value indicating whether the text inside the cell allows wrapping. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	VerticalAlignment	Gets or sets the vertical alignment of the cell content regarding the cell. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Visibility	Gets or sets whether the column is visible. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Width	Gets or sets the width of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

Public Methods

	Name	Description
	BeginEdit	Overridden.
	BindCellContent	(Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	CancelCellEdit	Overridden.

	ClearValue	(Inherited from System.Windows.DependencyObject)
	CreateCellContent	Gets a TextBlock that will be used to display the info inside a cell of this column. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	CreateGroupContent	(Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	EndEdit	Overridden.
	GetActualCulture	Gets the culture in which the text and numbers of this columns will be shown. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	GetActualFormat	Gets the format that will be applied in the column considering different sources like Format property or StringFormat of the Binding property. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	GetAnimationBaseValue	(Inherited from System.Windows.DependencyObject)
	GetCellContentRecyclingKey	(Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	GetCellEditingContent	Overridden. Gets a C1NumericBox that will be used to display the info into a cell of this column when the row is in edit mode.
	GetCellText	Gets the text shown inside a cell. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GetCellValue	(Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	GetColumnText	Gets the text shown in the column header. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

	GetFilter	Overridden.
	GetGroupText	(Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	GetValue	(Inherited from System.Windows.DependencyObject)
	PrepareCellForEdit	Overridden.
	ReadLocalValue	(Inherited from System.Windows.DependencyObject)
	SetCellValue	(Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	SetValue	(Inherited from System.Windows.DependencyObject)
	ToString	Returns a **System.String** that represents the current **System.Object**. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	UnbindCellContent	(Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)

DataGridNumericColumn Constructor

Overload List

Overload	Description
DataGridNumericColumn Constructor()	Initializes a new instance of a DataGridNumericColumn.
DataGridNumericColumn Constructor(PropertyInfo)	Initializes a new instance of the DataGridNumericColumn class.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

DataGridNumericColumn Constructor()

Initializes a new instance of a DataGridNumericColumn.

Syntax

Visual Basic (Declaration)

```
Public Function New()
```

C#

```
public DataGridNumericColumn()
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

DataGridNumericColumn Constructor(PropertyInfo)

The property info used to initialize the column.

Initializes a new instance of the DataGridNumericColumn class.

Syntax

Visual Basic (Declaration)

```
Public Function New( _
   ByVal property As System.Reflection.PropertyInfo _
)
```

C#

```
public DataGridNumericColumn(
   System.Reflection.PropertyInfo property
```

)

Parameters

property

The property info used to initialize the column.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GetCellEditingContent Method

Gets a C1NumericBox that will be used to display the info into a cell of this column when the row is in edit mode.

Syntax

Visual Basic (Declaration)

```
Public Overrides Function GetCellEditingContent( _
   ByVal row As DataGridRow _
) As System.Windows.FrameworkElement
```

C#

```
public override System.Windows.FrameworkElement GetCellEditingContent(
   DataGridRow row
)
```

Parameters

row

Return Value

C1NumericBox that represent a cell content in edit mode.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Public Properties

	Name	Description
	ActualCanUserFilter	Gets a value indicating whether a user can perform a filter operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserGroup	Gets a value indicating whether a user can perform a group operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserResize	(Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserSort	Gets a value indicating whether a user can perform a sort operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualFilterMemberPath	Gets the actual FilterMemberPath. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	ActualGroupHeader	(Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualSortMemberPath	Gets the actual SortMemberPath. (Inherited from

		C1.Silverlight.DataGrid.DataGridBoundColumn)
	ActualWidth	Gets the actual width in pixels. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	AllowNull	Gets or sets a value indicating whether the editing control allows null values. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	Binding	Gets or sets the binding object used to bind the visual element against the data. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	CanUserFilter	Gets or sets a value indicating whether the user can filter by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserGroup	Gets or sets a value indicating whether the user can group by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserMove	Gets or sets a value that indicates whether the user can change the column display order by dragging column headers with the mouse. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserResize	Gets or sets whether the user can resize the column by dragging the border on the right of the column header presenter. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserResizeRows	Gets or sets whether the user can resize the rows manipulating cells in this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserSort	Gets or sets a value indicating whether the user can sort by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CellContentStyle	Gets or sets the style applied to the content of a cell in read mode. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

	CellEditingContentStyle	Gets or sets the style applied to the content of a cell in edit mode. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CellStyle	Gets or sets the style applied to every cell of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	DataGrid	Gets the owner data grid. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	DefaultConverter	Overridden.
	Dispatcher	(Inherited from System.Windows.DependencyObject)
	DisplayIndex	Gets or sets the desired index in which the column will be displayed. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	EditOnSelection	Gets or sets a value indicating how the cells enters in edit mode when the user clicks on a cell of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Filter	Gets or sets the filter used in this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	FilterMemberPath	Gets or sets a property name, or a period-delimited hierarchy of property names, that indicates the member to filter by. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	FilterState	Gets the filter state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Format	Gets or sets the format of the content of the cells belonging this column. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	GroupContentConverter	Gets or sets the converter that will be applied to the visual element that is inside the content of each group row. (Inherited

		from C1.Silverlight.DataGrid.DataGridColumn)
	GroupContentStyle	Gets or sets the style applied to the title of each group row related to this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupConverter	Gets or sets the converter used to customize the grouping behavior. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupHeader	Gets or sets the header that will appear in the grouping panel as the column header is dragged there. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupState	Gets the grouping state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HandleUpDownKeys	Gets or sets a value indicating whether handle up and down keys.
	Header	Gets or sets the content of the header (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HeaderPresenter	Gets the presenter corresponding to the header of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HeaderStyle	Gets or sets the style of the header. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HorizontalAlignment	Gets or sets the horizontal alignment of the cell content regarding the cell. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HorizontalOffset	Gets the horizontal offset in pixels. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Index	Gets the index of a column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

	IsAutoGenerated	Gets a value that indicates whether the column is auto-generated. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsEditable	(Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	IsFrozen	Gets a value indicating whether this column is moved out of the viewport when the user scrolls the data grid. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsMouseOver	Gets a value indicating whether the mouse is over the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsReadOnly	Gets or sets whether the cells in the column are read only. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsSelectable	Gets or sets a value indicating whether the user is allowed to set the current cell from this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsSelected	Gets a value indicating whether this column is selected. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Maximum	Gets or sets the maximum value allowed for the **C1.Silverlight.C1NumericBox**.
	MaxWidth	Gets or sets the maximum width of the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Minimum	Gets or sets the minimum value allowed for the **C1.Silverlight.C1NumericBox**.
	MinWidth	Gets or sets the minimum width of the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Name	Gets or sets the name of the column. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)

	RangeValidationMode	Gets or sets the mode used to validate the range between Minimum and Maximum.
	ShowButtons	Shows or hides the buttons for Increment or Decrement.
	SortMemberPath	Gets or sets a property name, or a period-delimited hierarchy of property names, that indicates the member to sort by. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	SortState	Gets the sorting state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Tag	Gets or sets the tag. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	TextTrimming	Gets or sets a value indicating whether the text inside the cell allows trimming. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	TextWrapping	Gets or sets a value indicating whether the text inside the cell allows wrapping. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	VerticalAlignment	Gets or sets the vertical alignment of the cell content regarding the cell. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Visibility	Gets or sets whether the column is visible. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Width	Gets or sets the width of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

DefaultConverter Property

Syntax

Visual Basic (Declaration)
`Public Overrides ReadOnly Property DefaultConverter As System.Windows.Data.IValueConverter`
C#
`public override System.Windows.Data.IValueConverter DefaultConverter {get;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

HandleUpDownKeys Property

Gets or sets a value indicating whether handle up and down keys.

Syntax

Visual Basic (Declaration)
`Public Property HandleUpDownKeys As System.Boolean`
C#
`public System.bool HandleUpDownKeys {get; set;}`

Property Value

`true` if handle up and down keys; otherwise, `false`.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Maximum Property

Gets or sets the maximum value allowed for the **C1.Silverlight.C1NumericBox**.

Syntax

Visual Basic (Declaration)

```
Public Property Maximum As System.Double
```

C#

```
public System.double Maximum {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Minimum Property

Gets or sets the minimum value allowed for the **C1.Silverlight.C1NumericBox**.

Syntax

Visual Basic (Declaration)

```
Public Property Minimum As System.Double
```

C#

```
public System.double Minimum {get; set;}
```

Property Value

The minimum.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

RangeValidationMode Property
Gets or sets the mode used to validate the range between Minimum and Maximum.

Syntax

Visual Basic (Declaration)

```
Public Property RangeValidationMode As C1.Silverlight.RangeValidationMode
```

C#

```
public C1.Silverlight.RangeValidationMode RangeValidationMode {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ShowButtons Property
Shows or hides the buttons for Increment or Decrement.

Syntax

Visual Basic (Declaration)	
`Public Property ShowButtons As System.Boolean`	
C#	
`public System.bool ShowButtons {get; set;}`	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Convert Method

The source data being passed to the target.

The **System.Type** of data expected by the target dependency property.

An optional parameter to be used in the converter logic.

The culture of the conversion.

Modifies the source data before passing it to the target for display in the UI.

Syntax

Visual Basic (Declaration)

```
Public Overrides Function Convert( _
   ByVal value As System.Object, _
   ByVal targetType As System.Type, _
   ByVal parameter As System.Object, _
   ByVal culture As System.Globalization.CultureInfo _
) As System.Object
```

C#

```
public override System.object Convert(
   System.object value,
   System.Type targetType,
   System.object parameter,
   System.Globalization.CultureInfo culture
```

```
)
```

Parameters

value

The source data being passed to the target.

targetType

The **System.Type** of data expected by the target dependency property.

parameter

An optional parameter to be used in the converter logic.

culture

The culture of the conversion.

Return Value

The value to be passed to the target dependency property.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ConvertBack Method

The target data being passed to the source.

The **System.Type** of data expected by the source object.

An optional parameter to be used in the converter logic.

The culture of the conversion.

Modifies the target data before passing it to the source object. This method is called only in **System.Windows.Data.BindingMode.TwoWay** bindings.

Syntax

Visual Basic (Declaration)

```
Public Overrides Function ConvertBack( _
   ByVal value As System.Object, _
   ByVal targetType As System.Type, _
   ByVal parameter As System.Object, _
   ByVal culture As System.Globalization.CultureInfo _
) As System.Object
```

C#

```
public override System.object ConvertBack(
   System.object value,
   System.Type targetType,
   System.object parameter,
   System.Globalization.CultureInfo culture
)
```

Parameters

value

The target data being passed to the source.

targetType

The **System.Type** of data expected by the source object.

parameter

An optional parameter to be used in the converter logic.

culture

The culture of the conversion.

Return Value

The value to be passed to the source object.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Clear Method

Clears the current filter criteria and the values contained in the filter control.

Syntax

Visual Basic (Declaration)	

```
Public Sub Clear()
```

C#

```
public void Clear()
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

DataGridNumericFilter Class
DataGridNumericFilter Members

Create Method

Creates the filter based on the current filter criteria set by the user in the filter control. Raises the FilterChanged event if necessary.

Syntax

Visual Basic (Declaration)

```
Public Sub Create()
```

C#

```
public void Create()
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

DataGridNumericFilter Members

Load Method

the desired state.

Initializes the filter and filter control to the desired state.

Syntax

Visual Basic (Declaration)

```
Public Sub Load( _
   ByVal filterState As DataGridFilterState _
)
```

C#

```
public void Load(
   DataGridFilterState filterState
)
```

Parameters

filterState

the desired state.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

OnApplyTemplate Method

Builds the visual tree for the DataGridNumericFilter control when a new template is applied.

Syntax

Visual Basic (Declaration)

```
Public Overrides Sub OnApplyTemplate()
```

C#

```
public override void OnApplyTemplate()
```

Remarks

This method is invoked whenever application code or an internal process, such as a rebuilding layout pass, calls the **ApplyTemplate** method.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Public Properties

	Name	Description
	ActualHeight	(Inherited from System.Windows.FrameworkElement)
	ActualWidth	(Inherited from System.Windows.FrameworkElement)
	AllowDrop	(Inherited from System.Windows.UIElement)
	Background	(Inherited from System.Windows.Controls.Control)
	BorderBrush	(Inherited from System.Windows.Controls.Control)
	BorderThickness	(Inherited from System.Windows.Controls.Control)
	CacheMode	(Inherited from System.Windows.UIElement)

	CharacterSpacing	(Inherited from System.Windows.Controls.Control)
	Clip	(Inherited from System.Windows.UIElement)
	Combination	Gets or sets the logical combination between the first and second line.
	Cursor	(Inherited from System.Windows.FrameworkElement)
	DataContext	(Inherited from System.Windows.FrameworkElement)
	DesiredSize	(Inherited from System.Windows.UIElement)
	Dispatcher	(Inherited from System.Windows.DependencyObject)
	Effect	(Inherited from System.Windows.UIElement)
	Filter	Gets or sets the filter shown in the unity.
	FirstComparator	Gets or sets the comparator used in the first line.
	FirstValue	Gets or sets the value used in the first line.
	FlowDirection	(Inherited from System.Windows.FrameworkElement)
	FocusBrush	Gets or sets the **System.Windows.Media.Brush** used to highlight the focused control.
	FontFamily	(Inherited from System.Windows.Controls.Control)
	FontSize	(Inherited from System.Windows.Controls.Control)
	FontStretch	(Inherited from System.Windows.Controls.Control)
	FontStyle	(Inherited from System.Windows.Controls.Control)
	FontWeight	(Inherited from System.Windows.Controls.Control)

	Foreground	(Inherited from System.Windows.Controls.Control)
	Format	Gets or sets the format used in the numeric boxes.
	Height	(Inherited from System.Windows.FrameworkElement)
	HorizontalAlignment	(Inherited from System.Windows.FrameworkElement)
	HorizontalContentAlignment	(Inherited from System.Windows.Controls.Control)
	InputBackground	Gets or sets the **System.Windows.Media.Brush** that fills the background of the input control.
	InputForeground	Gets or sets the **System.Windows.Media.Brush** applied to the text inside an input control when this text is not selected.
	IsEnabled	(Inherited from System.Windows.Controls.Control)
	IsHitTestVisible	(Inherited from System.Windows.UIElement)
	IsTabStop	(Inherited from System.Windows.Controls.Control)
	Language	(Inherited from System.Windows.FrameworkElement)
	Margin	(Inherited from System.Windows.FrameworkElement)
	MaxHeight	(Inherited from System.Windows.FrameworkElement)
	MaxWidth	(Inherited from System.Windows.FrameworkElement)
	MinHeight	(Inherited from System.Windows.FrameworkElement)
	MinWidth	(Inherited from System.Windows.FrameworkElement)
	MouseOverBrush	Gets or sets the **System.Windows.Media.Brush** used to highlight the control when it has the mouse over.

	Name	(Inherited from System.Windows.FrameworkElement)
	Opacity	(Inherited from System.Windows.UIElement)
	OpacityMask	(Inherited from System.Windows.UIElement)
	Operators	
	Padding	(Inherited from System.Windows.Controls.Control)
	Parent	(Inherited from System.Windows.FrameworkElement)
	PressedBrush	Gets or sets the **System.Windows.Media.Brush** used to paint a button when it is pressed.
	Projection	(Inherited from System.Windows.UIElement)
	RenderSize	(Inherited from System.Windows.UIElement)
	RenderTransform	(Inherited from System.Windows.UIElement)
	RenderTransformOrigin	(Inherited from System.Windows.UIElement)
	Resources	(Inherited from System.Windows.FrameworkElement)
	SecondComparator	Gets or sets the comparator of the second line.
	SecondValue	Gets or sets the value of the second line.
	SelectedBackground	Gets or sets the **System.Windows.Media.Brush** used to highlight the control when it is selected.
	Style	(Inherited from System.Windows.FrameworkElement)
	TabIndex	(Inherited from System.Windows.Controls.Control)
	TabNavigation	(Inherited from System.Windows.Controls.Control)

FirstComparator Property

Gets or sets the comparator used in the first line.

Syntax

Visual Basic (Declaration)

```
Public Property FirstComparator As DataGridFilterOperation
```

C#

```
public DataGridFilterOperation FirstComparator {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Format Property

Gets or sets the format used in the numeric boxes.

Syntax

Visual Basic (Declaration)

```
Public Property Format As System.String
```

C#

```
public System.string Format {get; set;}
```

Property Value

The format used in the numeric boxes.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

FilterChanged Event

Occurs when the filter criteria changes.

Syntax

Visual Basic (Declaration)
`Public Event FilterChanged As System.EventHandler(Of PropertyChangedEventArgs(Of DataGridFilterState))`
C#
`public event System.EventHandler<PropertyChangedEventArgs<DataGridFilterState>> FilterChanged`

Event Data

The event handler receives an argument of type C1.Silverlight.PropertyChangedEventArgs<T> containing data related to this event. The following **PropertyChangedEventArgs<T>** properties provide information specific to this event.

Property	Description

NewValue	
OldValue	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Members

Fields Properties Methods Events

The following tables list the members exposed by DataGridRow.

Public Constructors

	Name	Description
	DataGridRow Constructor	Initializes a new instance of the DataGridRow class.

Top

Public Fields

	Name	Description
S	HeightProperty	Identifies the Height dependency property.
S	MaxHeightProperty	Identifies the MaxHeight dependency property.
S	MinHeightProperty	Identifies the MinHeight dependency property.

Top

Public Properties

	Name	Description
	ActualCanUserToggleDetails	Gets or sets a value indicating whether the user can toggle details, taking in consideration properties of the containing DataGrid.
	ActualDetailsVisibility	Gets a value indicating whether this row is showing details, taking in consideration properties of the containing DataGrid.
	ActualHeight	Gets the actual height in pixels.

	ActualHeightWithoutDetails	Gets the actual height in pixels (without the details).
	CanUserResize	Gets or sets a value indicating whether this row can be resized by the user.
	CanUserToggleDetails	Gets or sets a value indicating whether the user can toggle details.
	CellStyle	Gets or sets the style applied to all the cells of this row.
	DataGrid	Gets the data grid to which the row belongs.
	DataItem	Gets the data of the row.
	DetailsPresenter	Gets the visual element that will be arranged at the bottom of the row.
	DetailsVisibility	Gets or sets a value indicating whether this row is showing details.
	Dispatcher	(Inherited from System.Windows.DependencyObject)
	Errors	Gets the collection of errors associated with this row. Add errors here if you want to display an error message in the corresponding row header.
	HeaderPresenter	Gets the visual element that represent the header of this row.
	Height	Gets or sets the height of this row.
	IndentWidth	Gets the distance between the row header and the first cell of the row. This empty space is only present when there are groups in the data grid.
	Index	Gets the index of the row.
	IsEditable	Gets a value indicating whether this row is editable.

	IsEditing	Gets or sets a value indicating whether this row is editing.
	IsMouseOver	Gets a value indicating whether the mouse is over the row.
	IsSelectable	Gets or sets a value indicating whether the user is allowed to set the current cell from this row.
	IsSelected	Gets a value indicating whether this row is selected.
	Level	Gets the grouping level of this row. This info will be used to indent the row if the grid data is grouped.
	MaxHeight	Gets or sets the maximum height (in pixels) allowed.
	MinHeight	Gets or sets the minimum height (in pixels) allowed.
	ParentCollection	Gets the collection of rows to which this row belongs.
	ParentGroup	Gets the parent group.
	Presenter	Gets the visual element that represent this row.
	RowHeaderStyle	Gets or sets the style applied to the row header presenter of this row.
	RowStyle	Gets or sets the style of the row.
	ShowVerticalFreezingSeparator	Gets a value indicating whether to show vertical freezing separator.
	Type	Gets the type of row.
	ValidationResults	Gets the collection of errors associated with this row. Add errors here if you want to display an error message in the corresponding row header.
	VerticalOffset	Gets the vertical offset in pixels.

	Visibility	Gets or sets the visibility of the row.

Top

Public Methods

	Name	Description
	ClearValue	(Inherited from System.Windows.DependencyObject)
	GetAnimationBaseValue	(Inherited from System.Windows.DependencyObject)
	GetCellPresenter	
	GetValue	(Inherited from System.Windows.DependencyObject)
	ReadLocalValue	(Inherited from System.Windows.DependencyObject)
	Refresh	Unload every visual element which is related to the row.
	SetValue	(Inherited from System.Windows.DependencyObject)
	ToString	Returns a **System.String** that represents the current **System.Object**.
	Validate	Overloaded. Validates the DataItem. Implement IDataErrorInfo or INotifyDataErrorInfo in order to implement your own validation rules.

Top

Public Events

	Name	Description
	CanUserResizeChanged	Occurs after the CanUserResize value changed.
	CanUserToggleDetailsChanged	Occurs after the CanUserToggleDetails value changed.

	DetailsVisibilityChanged	Occurs after the visibility of the details of the row changed.
	HeightChanged	Occurs after the height was changed.
	IsEditingChanged	Occurs when the IsEditing value changed.
	Loaded	Occurs after the row is added to the collection of rows.
	PropertyChanged	Occurs when a property value changes.
	VisibilityChanged	Occurs after the visibility of the row changed.

Methods

%%scrap%%

" -->

For a list of all members of this type, see DataGridRow members.

Public Methods

	Name	Description
	ClearValue	(Inherited from System.Windows.DependencyObject)
	GetAnimationBaseValue	(Inherited from System.Windows.DependencyObject)
	GetCellPresenter	
	GetValue	(Inherited from System.Windows.DependencyObject)
	ReadLocalValue	(Inherited from System.Windows.DependencyObject)
	Refresh	Unload every visual element which is related to the row.
	SetValue	(Inherited from System.Windows.DependencyObject)
	ToString	Returns a **System.String** that represents the current **System.Object**.
	Validate	Overloaded. Validates the DataItem. Implement IDataErrorInfo or INotifyDataErrorInfo in order to implement your own validation rules.

GetCellPresenter Method

Syntax

Visual Basic (Declaration)

```
Public Function GetCellPresenter( _
   ByVal column As DataGridColumn _
) As DataGridCellPresenter
```

C#

```
public DataGridCellPresenter GetCellPresenter(
   DataGridColumn column
)
```

Parameters

column

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Refresh Method

if set to `true` row presenter is refreshed.

if set to `true` cells presenters are refreshed.

if set to `true` row header presenter is refreshed.

Unload every visual element which is related to the row.

Syntax

Visual Basic (Declaration)

```
Public Sub Refresh( _
   Optional ByVal refreshRow As System.Boolean, _
```

```
   Optional ByVal refreshCells As System.Boolean, _
   Optional ByVal refreshRowHeader As System.Boolean _
)
```

C#

```
public void Refresh(
   System.bool refreshRow,
   System.bool refreshCells,
   System.bool refreshRowHeader
)
```

Parameters

refreshRow

if set to `true` row presenter is refreshed.

refreshCells

if set to `true` cells presenters are refreshed.

refreshRowHeader

if set to `true` row header presenter is refreshed.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ToString Method

Returns a **System.String** that represents the current **System.Object**.

Syntax

Visual Basic (Declaration)

```
Public Overrides Function ToString() As System.String
```

C#

```
public override System.string ToString()
```

Return Value

A **System.String** that represents the current **System.Object**.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Validate Method

Validates the DataItem. Implement IDataErrorInfo or INotifyDataErrorInfo in order to implement your own validation rules.

Overload List

Overload	Description
Validate()	Validates the DataItem. Implement IDataErrorInfo or INotifyDataErrorInfo in order to implement your own validation rules.
Validate(Boolean)	Validates the DataItem. Implement IDataErrorInfo or INotifyDataErrorInfo in order to implement your own validation rules.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Validate() Method
Validates the DataItem. Implement IDataErrorInfo or INotifyDataErrorInfo in order to implement your own validation rules.

Syntax

Visual Basic (Declaration)

```
Public Overloads Function Validate() As System.Boolean
```

C#

```
public System.bool Validate()
```

Remarks

After this method is executed the collection ValidationResults will contain the errors.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

DataGridRow Class
DataGridRow Members
Overload List

Validate(Boolean) Method
if set to `true` validate all properties.

Validates the DataItem. Implement IDataErrorInfo or INotifyDataErrorInfo in order to implement your own validation rules.

Syntax

Visual Basic (Declaration)

```
Public Overloads Overridable Function Validate( _
   ByVal validateAllProperties As System.Boolean _
```

```
) As System.Boolean
```

C#

```
public virtual System.bool Validate(
   System.bool validateAllProperties
)
```

Parameters

validateAllProperties

if set to `true` validate all properties.

Remarks

After this method is executed the collection ValidationResults will contain the errors.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Properties

%%scrap%%

" -->

For a list of all members of this type, see DataGridRow members.

Public Properties

	Name	Description
	ActualCanUserToggleDetails	Gets or sets a value indicating whether the user can toggle details, taking in consideration properties of the containing DataGrid.

	ActualDetailsVisibility	Gets a value indicating whether this row is showing details, taking in consideration properties of the containing DataGrid.
	ActualHeight	Gets the actual height in pixels.
	ActualHeightWithoutDetails	Gets the actual height in pixels (without the details).
	CanUserResize	Gets or sets a value indicating whether this row can be resized by the user.
	CanUserToggleDetails	Gets or sets a value indicating whether the user can toggle details.
	CellStyle	Gets or sets the style applied to all the cells of this row.
	DataGrid	Gets the data grid to which the row belongs.
	DataItem	Gets the data of the row.
	DetailsPresenter	Gets the visual element that will be arranged at the bottom of the row.
	DetailsVisibility	Gets or sets a value indicating whether this row is showing details.
	Dispatcher	(Inherited from System.Windows.DependencyObject)
	Errors	Gets the collection of errors associated with this row. Add errors here if you want to display an error message in the corresponding row header.
	HeaderPresenter	Gets the visual element that represent the header of this row.
	Height	Gets or sets the height of this row.
	IndentWidth	Gets the distance between the row header and the first cell

		of the row. This empty space is only present when there are groups in the data grid.
	Index	Gets the index of the row.
	IsEditable	Gets a value indicating whether this row is editable.
	IsEditing	Gets or sets a value indicating whether this row is editing.
	IsMouseOver	Gets a value indicating whether the mouse is over the row.
	IsSelectable	Gets or sets a value indicating whether the user is allowed to set the current cell from this row.
	IsSelected	Gets a value indicating whether this row is selected.
	Level	Gets the grouping level of this row. This info will be used to indent the row if the grid data is grouped.
	MaxHeight	Gets or sets the maximum height (in pixels) allowed.
	MinHeight	Gets or sets the minimum height (in pixels) allowed.
	ParentCollection	Gets the collection of rows to which this row belongs.
	ParentGroup	Gets the parent group.
	Presenter	Gets the visual element that represent this row.
	RowHeaderStyle	Gets or sets the style applied to the row header presenter of this row.
	RowStyle	Gets or sets the style of the row.
	ShowVerticalFreezingSeparator	Gets a value indicating whether to show vertical freezing separator.

	Type	Gets the type of row.
	ValidationResults	Gets the collection of errors associated with this row. Add errors here if you want to display an error message in the corresponding row header.
	VerticalOffset	Gets the vertical offset in pixels.
	Visibility	Gets or sets the visibility of the row.

ActualCanUserToggleDetails Property

Gets or sets a value indicating whether the user can toggle details, taking in consideration properties of the containing DataGrid.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property ActualCanUserToggleDetails As System.Boolean
```

C#

```
public System.bool ActualCanUserToggleDetails {get;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

ActualDetailsVisibility Property

Gets a value indicating whether this row is showing details, taking in consideration properties of the containing DataGrid.

Syntax

Visual Basic (Declaration)
`Public ReadOnly Property ActualDetailsVisibility As System.Windows.Visibility`
C#
`public System.Windows.Visibility ActualDetailsVisibility {get;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ActualHeight Property

Gets the actual height in pixels.

Syntax

Visual Basic (Declaration)
`Public ReadOnly Property ActualHeight As System.Double`
C#
`public System.double ActualHeight {get;}`

Property Value

The actual height in pixels.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

ActualHeightWithoutDetails Property
Gets the actual height in pixels (without the details).

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property ActualHeightWithoutDetails As System.Double
```

C#

```
public System.double ActualHeightWithoutDetails {get;}
```

Property Value

The actual height in pixels.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CanUserResize Property
Gets or sets a value indicating whether this row can be resized by the user.

Syntax

Visual Basic (Declaration)

```
Public Property CanUserResize As System.Boolean
```

C#

```
public System.bool CanUserResize {get; set;}
```

Property Value

`true` if this row can be resized by the user; otherwise, `false`.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CanUserToggleDetails Property
Gets or sets a value indicating whether the user can toggle details.

Syntax

Visual Basic (Declaration)

```
Public Property CanUserToggleDetails As System.Boolean
```

C#

```
public System.bool CanUserToggleDetails {get; set;}
```

Property Value

`true` if the user can toggle details; otherwise, `false`.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CellStyle Property

Gets or sets the style applied to all the cells of this row.

Syntax

Visual Basic (Declaration)

```
Public Property CellStyle As System.Windows.Style
```

C#

```
public System.Windows.Style CellStyle {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

DataGridRow Members

DataGrid Property

Gets the data grid to which the row belongs.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property DataGrid As C1DataGrid
```

C#

```
public C1DataGrid DataGrid {get;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

DataItem Property

Gets the data of the row.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property DataItem As System.Object
```

C#

```
public System.object DataItem {get;}
```

Property Value

The data of the row.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

DetailsPresenter Property

Gets the visual element that will be arranged at the bottom of the row.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property DetailsPresenter As DataGridDetailsPresenter
```

C#

```
public DataGridDetailsPresenter DetailsPresenter {get;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

DetailsVisibility Property

Gets or sets a value indicating whether this row is showing details.

Syntax

Visual Basic (Declaration)

```
Public Property DetailsVisibility As System.Windows.Visibility
```

C#

```
public System.Windows.Visibility DetailsVisibility {get; set;}
```

Property Value

`true` if this row is showing details; otherwise, `false`.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

DataGridRow Class
DataGridRow Members

Errors Property

Gets the collection of errors associated with this row. Add errors here if you want to display an error message in the corresponding row header.

Syntax

Visual Basic (Declaration)
`Public ReadOnly Property Errors As System.Collections.ObjectModel.ObservableCollection(Of DataGridRowError)`
C#
`public System.Collections.ObjectModel.ObservableCollection<DataGridRowError> Errors {get;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

DataGridRow Class
DataGridRow Members

HeaderPresenter Property

Gets the visual element that represent the header of this row.

Syntax

Visual Basic (Declaration)
`Public ReadOnly Property HeaderPresenter As DataGridRowHeaderPresenter`
C#
`public DataGridRowHeaderPresenter HeaderPresenter {get;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

DataGridRow Class
DataGridRow Members

Height Property
Gets or sets the height of this row.

Syntax

Visual Basic (Declaration)
`Public Property Height As DataGridLength`
C#
`public DataGridLength Height {get; set;}`

Remarks

DataGridLength supports four different modes but only DataGridUnitType.Pixel and DataGridUnitType.Auto are supported for rows.

Type	Description
Pixel	The height of the row will be the same as the amount of pixels specified.
Auto	The height of the row will be determined by the content of the cells in the row.

Notice MinHeight and MaxHeight has precedence over this property, that mean that if you set Height=100 and MinHeight=110 the actual value will be 110.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IndentWidth Property

Gets the distance between the row header and the first cell of the row. This empty space is only present when there are groups in the data grid.

Syntax

Visual Basic (Declaration)
`Public ReadOnly Property IndentWidth As System.Double`
C#
`public System.double IndentWidth {get;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IsEditable Property

Gets a value indicating whether this row is editable.

Syntax

Visual Basic (Declaration)
`Public ReadOnly Property IsEditable As System.Boolean`
C#
`public System.bool IsEditable {get;}`

Property Value

`true` if this row is editable; otherwise, `false`.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IsEditing Property

Gets or sets a value indicating whether this row is editing.

Syntax

Visual Basic (Declaration)
`Public ReadOnly Property IsEditing As System.Boolean`
C#
`public System.bool IsEditing {get;}`

Property Value

`true` if this row is editing; otherwise, `false`.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IsMouseOver Property
Gets a value indicating whether the mouse is over the row.

Syntax

Visual Basic (Declaration)
`Public ReadOnly Property IsMouseOver As System.Boolean`
C#
`public System.bool IsMouseOver {get;}`

Property Value

`true` if the mouse is over the row; otherwise, `false`.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Level Property

Gets the grouping level of this row. This info will be used to indent the row if the grid data is grouped.

Syntax

Visual Basic (Declaration)

```
Public Overridable ReadOnly Property Level As System.Integer
```

C#

```
public virtual System.int Level {get;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ParentGroup Property

Gets the parent group.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property ParentGroup As DataGridGroupRow
```

C#

```
public DataGridGroupRow ParentGroup {get;}
```

Remarks

If the row is not part of a group `null` is returned.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

ShowVerticalFreezingSeparator Property

Gets a value indicating whether to show vertical freezing separator.

Syntax

Visual Basic (Declaration)
`Public ReadOnly Property ShowVerticalFreezingSeparator As System.Boolean`
C#
`public System.bool ShowVerticalFreezingSeparator {get;}`

Property Value

`true` if show vertical freezing separator; otherwise, `false`.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

Type Property

Gets the type of row.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property Type As DataGridRowType
```

C#

```
public DataGridRowType Type {get;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ValidationResults Property

Gets the collection of errors associated with this row. Add errors here if you want to display an error message in the corresponding row header.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property ValidationResults As
System.Collections.ObjectModel.ObservableCollection(Of ValidationResult)
```

C#

```
public System.Collections.ObjectModel.ObservableCollection<ValidationResult>
ValidationResults {get;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

VerticalOffset Property
Gets the vertical offset in pixels.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property VerticalOffset As System.Double
```

C#

```
public System.double VerticalOffset {get;}
```

Property Value

The vertical offset in pixels.

Remarks

Note this offset is estimated if the row presenter or previous rows have not been displayed before. double.Nan is returned if the template of the C1DataGrid has not been loaded.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

MaxHeightProperty Field

Identifies the MaxHeight dependency property.

Syntax

Visual Basic (Declaration)

```
Public Shared ReadOnly MaxHeightProperty As System.Windows.DependencyProperty
```

C#

```
public static readonly System.Windows.DependencyProperty MaxHeightProperty
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CanUserResizeChanged Event

Occurs after the CanUserResize value changed.

Syntax

Visual Basic (Declaration)	
`Public Event CanUserResizeChanged As System.EventHandler(Of PropertyChangedEventArgs(Of Boolean))`	

C#

```
public event System.EventHandler<PropertyChangedEventArgs<bool>>
CanUserResizeChanged
```

Event Data

The event handler receives an argument of type C1.Silverlight.PropertyChangedEventArgs<T> containing data related to this event. The following **PropertyChangedEventArgs<T>** properties provide information specific to this event.

Property	Description
NewValue	
OldValue	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CanUserToggleDetailsChanged Event

Occurs after the CanUserToggleDetails value changed.

Syntax

Visual Basic (Declaration)

```
Public Event CanUserToggleDetailsChanged As System.EventHandler(Of
PropertyChangedEventArgs(Of Boolean))
```

C#

```
public event System.EventHandler<PropertyChangedEventArgs<bool>>
CanUserToggleDetailsChanged
```

Event Data

The event handler receives an argument of type C1.Silverlight.PropertyChangedEventArgs<T> containing data related to this event. The following **PropertyChangedEventArgs<T>** properties provide information specific to this event.

Property	Description
NewValue	
OldValue	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

DetailsVisibilityChanged Event

Occurs after the visibility of the details of the row changed.

Syntax

Visual Basic (Declaration)
`Public Event DetailsVisibilityChanged As System.EventHandler(Of PropertyChangedEventArgs(Of Visibility))`
C#
`public event System.EventHandler<PropertyChangedEventArgs<Visibility>> DetailsVisibilityChanged`

Event Data

The event handler receives an argument of type C1.Silverlight.PropertyChangedEventArgs<T> containing data related to this event. The following **PropertyChangedEventArgs<T>** properties provide information specific to this event.

Property	Description

NewValue	
OldValue	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

HeightChanged Event
Occurs after the height was changed.

Syntax

Visual Basic (Declaration)
`Public Event HeightChanged As System.EventHandler(Of PropertyChangedEventArgs(Of DataGridLength))`
C#
`public event System.EventHandler<PropertyChangedEventArgs<DataGridLength>> HeightChanged`

Event Data

The event handler receives an argument of type C1.Silverlight.PropertyChangedEventArgs<T> containing data related to this event. The following **PropertyChangedEventArgs<T>** properties provide information specific to this event.

Property	Description
NewValue	
OldValue	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IsEditingChanged Event

Occurs when the IsEditing value changed.

Syntax

Visual Basic (Declaration)
`Public Event IsEditingChanged As System.EventHandler(Of PropertyChangedEventArgs(Of Boolean))`
C#
`public event System.EventHandler<PropertyChangedEventArgs<bool>> IsEditingChanged`

Event Data

The event handler receives an argument of type C1.Silverlight.PropertyChangedEventArgs<T> containing data related to this event. The following **PropertyChangedEventArgs<T>** properties provide information specific to this event.

Property	Description
NewValue	
OldValue	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

PropertyChanged Event

Occurs when a property value changes.

Syntax

Visual Basic (Declaration)
`Public Event PropertyChanged As System.ComponentModel.PropertyChangedEventHandler`
C#
`public event System.ComponentModel.PropertyChangedEventHandler PropertyChanged`

Event Data

The event handler receives an argument of type System.ComponentModel.PropertyChangedEventArgs containing data related to this event. The following **PropertyChangedEventArgs** properties provide information specific to this event.

Property	Description
PropertyName	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Members

Properties Methods Events

The following tables list the members exposed by DataGridRowCollection.

Public Properties

	Name	Description

	BottomRows	Gets the collection of rows that are located at bottom of the item rows.
	Count	Gets the count of rows.
	IsLoading	Gets or sets a value indicating whether this instance is loading.
	Item	Overloaded. Gets the DataGridRow with the specified data item.
	OwnerGroup	Gets or sets the group that owns this collection of rows. If the collection doesn't belong to a group this property will be null.
	TopRows	Gets the collection of rows that are located on top of the item rows.

Top

Public Methods

	Name	Description
	AsEnumerable	Returns the row collection as IEnumerable. i.e. All rows that are not DataGridGroupRow: AsEnumerable((r) => !(r is DataGridGroupRow), null); i.e. All currently rows being shown (include group children of visible groups): AsEnumerable(null, (g) => g.GroupRowsVisibility == Visibility.Visible)
	Collapse	Collapse the groups that satisfy the predicate.
	CollapseAll	Collapses all the groups.
	Contains	Determines whether this collection contains a row in the specified index.
	Expand	Expands the groups that satisfy the predicate.
	ExpandAll	Expands all the groups.
	GetEnumerator	Returns an enumerator that iterates through the collection.
	GetFirstVisibleRow	Gets the first visible row.

	GetLastVisibleRow	Gets the last visible row.
	GetLoadedRows	Gets the loaded rows until now.
	GetVisibleRowsFromBottom	Gets a collection of rows starting from the bottom.
	GetVisibleRowsFromIndex	Gets a collection of rows from a specified position and direction.
	GetVisibleRowsFromTop	Gets a collection of rows starting from the top.
	IndexOf	Gets the index of the specified data item.

Top

Public Events

	Name	Description
	CollectionChanged	Occurs when the items list of the collection has changed, or the collection is reset.

AsEnumerable Method

The predicate.

The recursion predicate. Where to process children rows in a group or not.

Returns the row collection as IEnumerable. i.e. All rows that are not DataGridGroupRow: AsEnumerable((r) => !(r is DataGridGroupRow), null); i.e. All currently rows being shown (include group children of visible groups): AsEnumerable(null, (g) => g.GroupRowsVisibility == Visibility.Visible)

Syntax

Visual Basic (Declaration)

```
Public Function AsEnumerable( _
   ByVal predicate As System.Predicate(Of DataGridRow), _
   ByVal recursionPredicate As System.Predicate(Of DataGridGroupRow) _
) As System.Collections.Generic.IEnumerable(Of DataGridRow)
```

C#

```
public System.Collections.Generic.IEnumerable<DataGridRow> AsEnumerable(
   System.Predicate<DataGridRow> predicate,
   System.Predicate<DataGridGroupRow> recursionPredicate
)
```

Parameters

predicate

The predicate.

recursionPredicate

The recursion predicate. Where to process children rows in a group or not.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

DataGridRowCollection Class
DataGridRowCollection Members

Collapse Method

The predicate.

Collapse the groups that satisfy the predicate.

Syntax

Visual Basic (Declaration)

```
Public Sub Collapse( _
   ByVal predicate As System.Predicate(Of DataGridGroupRow) _
)
```

C#

```
public void Collapse(
   System.Predicate<DataGridGroupRow> predicate
)
```

Parameters

predicate

The predicate.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

DataGridRowCollection Class
DataGridRowCollection Members

CollapseAll Method

Collapses all the groups.

Syntax

Visual Basic (Declaration)

```
Public Sub CollapseAll()
```

C#

```
public void CollapseAll()
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

Contains Method

The index.

Determines whether this collection contains a row in the specified index.

Syntax

Visual Basic (Declaration)

```
Public Function Contains( _
   ByVal index As System.Integer _
) As System.Boolean
```

C#

```
public System.bool Contains(
   System.int index
)
```

Parameters

index

The index.

Return Value

`true` if contains a row in the specified index; otherwise, `false`.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

DataGridRowCollection Class
DataGridRowCollection Members

Expand Method

The predicate.

Expands the groups that satisfy the predicate.

Syntax

Visual Basic (Declaration)

```
Public Sub Expand( _
   ByVal predicate As System.Predicate(Of DataGridGroupRow) _
)
```

C#

```
public void Expand(
   System.Predicate<DataGridGroupRow> predicate
)
```

Parameters

predicate

The predicate.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

DataGridRowCollection Class
DataGridRowCollection Members

ExpandAll Method

Expands all the groups.

Syntax

Visual Basic (Declaration)
`Public Sub ExpandAll()`
C#
`public void ExpandAll()`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

GetEnumerator Method

Returns an enumerator that iterates through the collection.

Syntax

Visual Basic (Declaration)
`Public Function GetEnumerator() As System.Collections.Generic.IEnumerator(Of DataGridRow)`
C#
`public System.Collections.Generic.IEnumerator<DataGridRow> GetEnumerator()`

Return Value

A **System.Collections.Generic.IEnumerator`1** that can be used to iterate through the collection.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GetFirstVisibleRow Method

Gets the first visible row.

Syntax

Visual Basic (Declaration)

```
Public Function GetFirstVisibleRow( _
   Optional ByVal includeCollapsedGroupRows As System.Boolean _
) As DataGridRow
```

C#

```
public DataGridRow GetFirstVisibleRow(
   System.bool includeCollapsedGroupRows
)
```

Parameters

includeCollapsedGroupRows

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

GetLastVisibleRow Method

Gets the last visible row.

Syntax

Visual Basic (Declaration)

```
Public Function GetLastVisibleRow( _
   Optional ByVal includeCollapsedGroupRows As System.Boolean _
) As DataGridRow
```

C#

```
public DataGridRow GetLastVisibleRow(
   System.bool includeCollapsedGroupRows
)
```

Parameters

includeCollapsedGroupRows

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

GetLoadedRows Method

Gets the loaded rows until now.

Syntax

Visual Basic (Declaration)

```
Public Function GetLoadedRows() As System.Collections.Generic.IEnumerable(Of
DataGridRow)
```

C#

```
public System.Collections.Generic.IEnumerable<DataGridRow> GetLoadedRows()
```

Return Value

Collection of loaded rows

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

GetVisibleRowsFromBottom Method

Gets a collection of rows starting from the bottom.

Syntax

Visual Basic (Declaration)

```
Public Function GetVisibleRowsFromBottom( _
   Optional ByVal includeCollapsedGroupRows As System.Boolean _
) As System.Collections.Generic.IEnumerable(Of DataGridRow)
```

C#

```
public System.Collections.Generic.IEnumerable<DataGridRow>
GetVisibleRowsFromBottom(
   System.bool includeCollapsedGroupRows
)
```

Parameters

includeCollapsedGroupRows

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

GetVisibleRowsFromIndex Method

Index of the first row.

The direction in which rows are returned.

Gets a collection of rows from a specified position and direction.

Syntax

Visual Basic (Declaration)

```
Public Function GetVisibleRowsFromIndex( _
   ByVal fromRowIndex As System.Integer, _
   ByVal direction As System.Windows.Controls.Primitives.GeneratorDirection,
_
   Optional ByVal includeCollapsedGroupRows As System.Boolean _
) As System.Collections.Generic.IEnumerable(Of DataGridRow)
```

C#

```
public System.Collections.Generic.IEnumerable<DataGridRow>
GetVisibleRowsFromIndex(
   System.int fromRowIndex,
   System.Windows.Controls.Primitives.GeneratorDirection direction,
   System.bool includeCollapsedGroupRows
)
```

Parameters

fromRowIndex

Index of the first row.

direction

The direction in which rows are returned.

includeCollapsedGroupRows

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GetVisibleRowsFromTop Method

Gets a collection of rows starting from the top.

Syntax

Visual Basic (Declaration)

```
Public Function GetVisibleRowsFromTop( _
   Optional ByVal includeCollapsedGroupRows As System.Boolean _
) As System.Collections.Generic.IEnumerable(Of DataGridRow)
```

C#

```
public System.Collections.Generic.IEnumerable<DataGridRow>
GetVisibleRowsFromTop(
   System.bool includeCollapsedGroupRows
)
```

Parameters

includeCollapsedGroupRows

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IndexOf Method

The data item.

Gets the index of the specified data item.

Syntax

Visual Basic (Declaration)

```
Public Function IndexOf( _
   ByVal dataItem As System.Object _
) As System.Integer
```

C#

```
public System.int IndexOf(
   System.object dataItem
)
```

Parameters

dataItem

The data item.

Return Value

The index, -1 if not found

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

`public event System.Collections.Specialized.NotifyCollectionChangedEventHandler CollectionChanged`

Event Data

The event handler receives an argument of type System.Collections.Specialized.NotifyCollectionChangedEventArgs containing data related to this event. The following **NotifyCollectionChangedEventArgs** properties provide information specific to this event.

Property	Description
Action	Gets the description of the action that caused the event.
NewItems	Gets the items affected by an action.
NewStartingIndex	Gets the index at which the change occurred.
OldItems	Gets the item affected by a **System.Collections.Specialized.NotifyCollectionChangedAction.Replace** or **System.Collections.Specialized.NotifyCollectionChangedAction.Remove** action.
OldStartingIndex	Gets the index at which the change occurred for a **System.Collections.Specialized.NotifyCollectionChangedAction.Replac**

	e or **System.Collections.Specialized.NotifyCollectionChangedAction.Remov** **e** action.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Public Constructors

	Name	Description
	DataGridRowHeaderColumn Constructor	Initializes a new instance of the DataGridRowHeaderColumn class.

Top

Public Properties

	Name	Description
	ActualCanUserFilter	Gets a value indicating whether a user can perform a filter operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserGroup	Gets a value indicating whether a user can perform a group operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserResize	(Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualCanUserSort	Gets a value indicating whether a user can perform a sort operation over this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualFilterMemberPath	Gets the actual FilterMemberPath. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	ActualGroupHeader	(Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	ActualSortMemberPath	Gets the actual SortMemberPath. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	ActualWidth	Gets the actual width in pixels. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	AllowNull	Gets or sets a value indicating whether the editing control allows null values. (Inherited from

		C1.Silverlight.DataGrid.DataGridBoundColumn)
	Binding	Gets or sets the binding object used to bind the visual element against the data. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	CanUserFilter	Gets or sets a value indicating whether the user can filter by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserGroup	Gets or sets a value indicating whether the user can group by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserMove	Gets or sets a value that indicates whether the user can change the column display order by dragging column headers with the mouse. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserResize	Gets or sets whether the user can resize the column by dragging the border on the right of the column header presenter. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserResizeRows	Gets or sets whether the user can resize the rows manipulating cells in this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CanUserSort	Gets or sets a value indicating whether the user can sort by this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CellContentStyle	Gets or sets the style applied to the content of a cell in read mode. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CellEditingContentStyle	Gets or sets the style applied to the content of a cell in edit mode. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	CellStyle	Gets or sets the style applied to every cell of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	DataGrid	Gets the owner data grid. (Inherited from

		C1.Silverlight.DataGrid.DataGridColumn)
	DefaultConverter	Gets the converter that will be used in each cell. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	Dispatcher	(Inherited from System.Windows.DependencyObject)
	DisplayIndex	Gets or sets the desired index in which the column will be displayed. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	EditOnSelection	Gets or sets a value indicating how the cells enters in edit mode when the user clicks on a cell of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Filter	Gets or sets the filter used in this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	FilterMemberPath	Gets or sets a property name, or a period-delimited hierarchy of property names, that indicates the member to filter by. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	FilterState	Gets the filter state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Format	Gets or sets the format of the content of the cells belonging this column. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	GroupContentConverter	Gets or sets the converter that will be applied to the visual element that is inside the content of each group row. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupContentStyle	Gets or sets the style applied to the title of each group row related to this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

	GroupConverter	Gets or sets the converter used to customize the grouping behavior. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupHeader	Gets or sets the header that will appear in the grouping panel as the column header is dragged there. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	GroupState	Gets the grouping state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Header	Gets or sets the content of the header (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HeaderPresenter	Gets the presenter corresponding to the header of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HeaderStyle	Gets or sets the style of the header. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HorizontalAlignment	Gets or sets the horizontal alignment of the cell content regarding the cell. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	HorizontalOffset	Gets the horizontal offset in pixels. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Index	Gets the index of a column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsAutoGenerated	Gets a value that indicates whether the column is auto-generated. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsEditable	(Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	IsFrozen	Gets a value indicating whether this column is moved out of the viewport when the user scrolls the data grid. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

	IsMouseOver	Gets a value indicating whether the mouse is over the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsReadOnly	Gets or sets whether the cells in the column are read only. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsSelectable	Gets or sets a value indicating whether the user is allowed to set the current cell from this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	IsSelected	Gets a value indicating whether this column is selected. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	MaxWidth	Gets or sets the maximum width of the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	MinWidth	Gets or sets the minimum width of the column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Name	Gets or sets the name of the column. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	SortMemberPath	Gets or sets a property name, or a period-delimited hierarchy of property names, that indicates the member to sort by. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	SortState	Gets the sorting state of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Tag	Gets or sets the tag. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	TextTrimming	Gets or sets a value indicating whether the text inside the cell allows trimming. (Inherited from C1.Silverlight.DataGrid.DataGridBoundColumn)
	TextWrapping	Gets or sets a value indicating whether the text inside the cell allows wrapping. (Inherited from

		C1.Silverlight.DataGrid.DataGridBoundColumn)
	VerticalAlignment	Gets or sets the vertical alignment of the cell content regarding the cell. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Visibility	Gets or sets whether the column is visible. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)
	Width	Gets or sets the width of this column. (Inherited from C1.Silverlight.DataGrid.DataGridColumn)

BindCellContent Method

Content of the cell.

The row.

Binds the content of the cell.

Syntax

Visual Basic (Declaration)

```
Public Overrides Sub BindCellContent( _
   ByVal cellContent As System.Windows.FrameworkElement, _
   ByVal row As DataGridRow _
)
```

C#

```
public override void BindCellContent(
   System.Windows.FrameworkElement cellContent,
   DataGridRow row
)
```

Parameters

cellContent

Content of the cell.

row

The row.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CreateCellContent Method

Gets a TextBlock that will be used to display the info into a cell of this column.

Syntax

Visual Basic (Declaration)

```
Public Overrides Function CreateCellContent( _
```

```
    ByVal row As DataGridRow _
) As System.Windows.FrameworkElement
```

C#

```
public override System.Windows.FrameworkElement CreateCellContent(
    DataGridRow row
)
```

Parameters

row

Return Value

TextBlock that represent the cell content.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

GetCellContentRecyclingKey Method

The row.

Gets the cell content recycling key.

Syntax

Visual Basic (Declaration)

```
Public Overrides Function GetCellContentRecyclingKey( _
    ByVal row As DataGridRow _
) As System.Object
```

C#

```
public override System.object GetCellContentRecyclingKey(
    DataGridRow row
```

```
)
```

Parameters

row

The row.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

UnbindCellContent Method

Content of the cell.

The row.

Unbinds the content of the cell.

Syntax

Visual Basic (Declaration)

```
Public Overrides Sub UnbindCellContent( _
   ByVal cellContent As System.Windows.FrameworkElement, _
   ByVal row As DataGridRow _
)
```

C#

```
public override void UnbindCellContent(
   System.Windows.FrameworkElement cellContent,
   DataGridRow row
)
```

Parameters

cellContent

Content of the cell.

row

The row.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Fields Properties Methods Events

The following tables list the members exposed by DataGridRowHeaderPresenter.

Public Constructors

	Name	Description
	DataGridRowHeaderPresenter Constructor	Initializes a new instance of a DataGridRowHeaderPresenter.

Top

Public Fields

	Name	Description
	CanUserResizeProperty	Identifies the CanUserResize dependency property.
	CanUserToggleDetailsProperty	Identifies the CanUserToggleDetails dependency property.
	DetailsVisibilityProperty	Identifies the DetailsVisibility dependency property.
	IsEditingProperty	Identifies the IsEditing dependency property.
	IsMergingProperty	Identifies the IsMerging dependency property.

S	IsMouseOverProperty	Identifies the IsMouseOver dependency property.
S	IsSelectedProperty	Identifies the IsSelected dependency property.
S	MouseOverBrushProperty	Identifies the MouseOverBrush dependency property.
S	PressedBrushProperty	Identifies the PressedBrush dependency property.
S	SelectedBackgroundProperty	Identifies the SelectedBackground dependency property.
S	ValidationBackgroundProperty	Identifies the ValidationBackground dependency property.
S	ValidationForegroundProperty	Identifies the ValidationForeground dependency property.
S	ValidationResultsProperty	Identifies the ValidationResults dependency property.
S	ValidationStateProperty	Identifies the ValidationState dependency property.

	Foreground	(Inherited from System.Windows.Controls.Control)
	Height	(Inherited from System.Windows.FrameworkElement)
	HorizontalAlignment	(Inherited from System.Windows.FrameworkElement)
	HorizontalContentAlignment	(Inherited from System.Windows.Controls.Control)
	IsEditing	Gets or sets a value indicating whether the row is currently being edited.
	IsEnabled	(Inherited from System.Windows.Controls.Control)
	IsHitTestVisible	(Inherited from System.Windows.UIElement)
	IsMerging	Gets or sets a value indicating whether the header may get merged.
	IsMouseOver	Returns true if the mouse is over the control.
	IsSelected	Gets or sets a value indicating whether the row is currently selected or not.
	IsTabStop	(Inherited from System.Windows.Controls.Control)
	Language	(Inherited from System.Windows.FrameworkElement)
	Margin	(Inherited from System.Windows.FrameworkElement)
	MaxHeight	(Inherited from System.Windows.FrameworkElement)
	MaxWidth	(Inherited from System.Windows.FrameworkElement)
	MinHeight	(Inherited from System.Windows.FrameworkElement)

	MinWidth	(Inherited from System.Windows.FrameworkElement)
	MouseOverBrush	Gets or sets the **System.Windows.Media.Brush** used to highlight the control when it has the mouse over.
	Name	(Inherited from System.Windows.FrameworkElement)
	Opacity	(Inherited from System.Windows.UIElement)
	OpacityMask	(Inherited from System.Windows.UIElement)
	Padding	(Inherited from System.Windows.Controls.Control)
	Parent	(Inherited from System.Windows.FrameworkElement)
	PressedBrush	Gets or sets the **System.Windows.Media.Brush** used to paint a button when it is pressed.
	Projection	(Inherited from System.Windows.UIElement)
	RenderSize	(Inherited from System.Windows.UIElement)
	RenderTransform	(Inherited from System.Windows.UIElement)
	RenderTransformOrigin	(Inherited from System.Windows.UIElement)
	Resources	(Inherited from System.Windows.FrameworkElement)
	Row	Gets the owner row.
	SelectedBackground	Gets or sets the **System.Windows.Media.Brush** used to highlight the control when it is selected.
	Style	(Inherited from System.Windows.FrameworkElement)
	TabIndex	(Inherited from System.Windows.Controls.Control)
	TabNavigation	(Inherited from System.Windows.Controls.Control)

	Tag	(Inherited from System.Windows.FrameworkElement)
	Template	(Inherited from System.Windows.Controls.Control)
	Triggers	(Inherited from System.Windows.FrameworkElement)
	UseLayoutRounding	(Inherited from System.Windows.UIElement)
	ValidationBackground	Gets or sets the brush used to paint the background of the validation elements.
	ValidationForeground	Gets or sets the brush used to paint the foreground of the validation elements.
	ValidationResults	Gets or sets a collection of ValidationResult related to the corresponding row. This errors will be displayed as red icon whit a tooltip showing the text of the error.
	ValidationState	Gets or sets the ValidationState of the related row.
	VerticalAlignment	(Inherited from System.Windows.FrameworkElement)
	VerticalContentAlignment	(Inherited from System.Windows.Controls.Control)
	Visibility	(Inherited from System.Windows.UIElement)
	Width	(Inherited from System.Windows.FrameworkElement)

Public Events

	Name	Description
	AutoSized	Occurs when the row header is auto sized.
	BindingValidationError	(Inherited from System.Windows.FrameworkElement)
	DataContextChanged	(Inherited from System.Windows.FrameworkElement)
	DragEnter	(Inherited from System.Windows.UIElement)
	DragLeave	(Inherited from System.Windows.UIElement)
	DragOver	(Inherited from System.Windows.UIElement)
	Drop	(Inherited from System.Windows.UIElement)
	GotFocus	(Inherited from System.Windows.UIElement)
	IsEnabledChanged	(Inherited from System.Windows.Controls.Control)
	IsMouseOverChanged	Event raised when the **IsMouseOver** property has changed.
	KeyDown	(Inherited from System.Windows.UIElement)
	KeyUp	(Inherited from System.Windows.UIElement)

	LayoutUpdated	(Inherited from System.Windows.FrameworkElement)
	Loaded	(Inherited from System.Windows.FrameworkElement)
	LostFocus	(Inherited from System.Windows.UIElement)
	LostMouseCapture	(Inherited from System.Windows.UIElement)
	MediaCommand	(Inherited from System.Windows.UIElement)
	MouseEnter	(Inherited from System.Windows.UIElement)
	MouseLeave	(Inherited from System.Windows.UIElement)
	MouseLeftButtonDown	(Inherited from System.Windows.UIElement)
	MouseLeftButtonUp	(Inherited from System.Windows.UIElement)
	MouseMove	(Inherited from System.Windows.UIElement)
	MouseRightButtonDown	(Inherited from System.Windows.UIElement)
	MouseRightButtonUp	(Inherited from System.Windows.UIElement)
	MouseWheel	(Inherited from System.Windows.UIElement)
	PropertyChanged	Occurs when a property value changes.
	Resized	Occurs when the row header is resized.
	Resizing	Occurs when the row header is resized.
	SizeChanged	(Inherited from System.Windows.FrameworkElement)
	TextInput	(Inherited from System.Windows.UIElement)
	TextInputStart	(Inherited from System.Windows.UIElement)

	TextInputUpdate	(Inherited from System.Windows.UIElement)
	Unloaded	(Inherited from System.Windows.FrameworkElement)

OnApplyTemplate Method

Builds the visual tree for the DataGridRowHeaderPresenter control when a new template is applied.

Syntax

Visual Basic (Declaration)

```
Public Overrides Sub OnApplyTemplate()
```

C#

```
public override void OnApplyTemplate()
```

Remarks

This method is invoked whenever application code or an internal process, such as a rebuilding layout pass, calls the **ApplyTemplate** method.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CanUserResize Property

Gets or sets a value indicating whether the user can adjust row height by dragging the bottom edge of the row header.

Syntax

Visual Basic (Declaration)

```
Public Property CanUserResize As System.Boolean
```

C#

```
public System.bool CanUserResize {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

CanUserToggleDetails Property

Gets or sets a value indicating whether the expand/collapse button is visible.

Syntax

Visual Basic (Declaration)

```
Public Property CanUserToggleDetails As System.Boolean
```

C#

```
public System.bool CanUserToggleDetails {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

DataGrid Property

Gets the owner data grid.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property DataGrid As C1DataGrid
```

C#

```
public C1DataGrid DataGrid {get;}
```

Property Value

The owner data grid.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

DetailsVisibility Property

Gets or sets the visibility of the details.

Syntax

Visual Basic (Declaration)
`Public Property DetailsVisibility As System.Windows.Visibility`
C#
`public System.Windows.Visibility DetailsVisibility {get; set;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

IsEditing Property

Gets or sets a value indicating whether the row is currently being edited.

Syntax

Visual Basic (Declaration)
`Public Property IsEditing As System.Boolean`
C#
`public System.bool IsEditing {get; set;}`

Remarks

If this property is set to true the visual state group "CommonStates" will change its visual state to "Editing".

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

IsMerging Property
Gets or sets a value indicating whether the header may get merged.

Syntax

Visual Basic (Declaration)
`Public Property IsMerging As System.Boolean`
C#
`public System.bool IsMerging {get; set;}`

Remarks

If this property is set to true the visual state group "MergingStates" will change its visual state to "Merging".

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IsSelected Property

Gets or sets a value indicating whether the row is currently selected or not.

Syntax

Visual Basic (Declaration)
`Public Property IsSelected As System.Boolean`

C#

```
public System.bool IsSelected {get; set;}
```

Remarks

If this property is set to true the visual state group "CommonStates" will change its visual state to "Selected".

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

MouseOverBrush Property

Gets or sets the **System.Windows.Media.Brush** used to highlight the control when it has the mouse over.

Syntax

Visual Basic (Declaration)

```
Public Property MouseOverBrush As System.Windows.Media.Brush
```

C#

```
public System.Windows.Media.Brush MouseOverBrush {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

PressedBrush Property

Gets or sets the **System.Windows.Media.Brush** used to paint a button when it is pressed.

Syntax

Visual Basic (Declaration)

```
Public Property PressedBrush As System.Windows.Media.Brush
```

C#

```
public System.Windows.Media.Brush PressedBrush {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Row Property

Gets the owner row.

Syntax

Visual Basic (Declaration)

```
Public ReadOnly Property Row As DataGridRow
```

C#

```
public DataGridRow Row {get;}
```

Property Value

The owner row.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

SelectedBackground Property

Gets or sets the **System.Windows.Media.Brush** used to highlight the control when it is selected.

Syntax

Visual Basic (Declaration)	
`Public Property SelectedBackground As System.Windows.Media.Brush`	
C#	
`public System.Windows.Media.Brush SelectedBackground {get; set;}`	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ValidationBackground Property

Gets or sets the brush used to paint the background of the validation elements.

Syntax

Visual Basic (Declaration)	
`Public Property ValidationBackground As System.Windows.Media.Brush`	

C#

```
public System.Windows.Media.Brush ValidationBackground {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ValidationForeground Property

Gets or sets the brush used to paint the foreground of the validation elements.

Syntax

Visual Basic (Declaration)

```
Public Property ValidationForeground As System.Windows.Media.Brush
```

C#

```
public System.Windows.Media.Brush ValidationForeground {get; set;}
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ValidationResults Property

Gets or sets a collection of ValidationResult related to the corresponding row. This errors will be displayed as red icon whit a tooltip showing the text of the error.

Syntax

Visual Basic (Declaration)
`Public Property ValidationResults As System.Collections.Generic.ICollection(Of ValidationResult)`
C#
`public System.Collections.Generic.ICollection<ValidationResult> ValidationResults {get; set;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

ValidationState Property

Gets or sets the ValidationState of the related row.

Syntax

Visual Basic (Declaration)
`Public Property ValidationState As C1.Silverlight.ValidationState`
C#
`public C1.Silverlight.ValidationState ValidationState {get; set;}`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Events

%%scrap%%

" -->

For a list of all members of this type, see DataGridRowHeaderPresenter members.

Public Events

	Name	Description
	AutoSized	Occurs when the row header is auto sized.
	BindingValidationError	(Inherited from System.Windows.FrameworkElement)
	DataContextChanged	(Inherited from System.Windows.FrameworkElement)
	DragEnter	(Inherited from System.Windows.UIElement)

	DragLeave	(Inherited from System.Windows.UIElement)
	DragOver	(Inherited from System.Windows.UIElement)
	Drop	(Inherited from System.Windows.UIElement)
	GotFocus	(Inherited from System.Windows.UIElement)
	IsEnabledChanged	(Inherited from System.Windows.Controls.Control)
	IsMouseOverChanged	Event raised when the **IsMouseOver** property has changed.
	KeyDown	(Inherited from System.Windows.UIElement)
	KeyUp	(Inherited from System.Windows.UIElement)
	LayoutUpdated	(Inherited from System.Windows.FrameworkElement)
	Loaded	(Inherited from System.Windows.FrameworkElement)
	LostFocus	(Inherited from System.Windows.UIElement)
	LostMouseCapture	(Inherited from System.Windows.UIElement)
	MediaCommand	(Inherited from System.Windows.UIElement)
	MouseEnter	(Inherited from System.Windows.UIElement)
	MouseLeave	(Inherited from System.Windows.UIElement)
	MouseLeftButtonDown	(Inherited from System.Windows.UIElement)
	MouseLeftButtonUp	(Inherited from System.Windows.UIElement)
	MouseMove	(Inherited from System.Windows.UIElement)
	MouseRightButtonDown	(Inherited from System.Windows.UIElement)

	MouseRightButtonUp	(Inherited from System.Windows.UIElement)
	MouseWheel	(Inherited from System.Windows.UIElement)
	PropertyChanged	Occurs when a property value changes.
	Resized	Occurs when the row header is resized.
	Resizing	Occurs when the row header is resized.
	SizeChanged	(Inherited from System.Windows.FrameworkElement)
	TextInput	(Inherited from System.Windows.UIElement)
	TextInputStart	(Inherited from System.Windows.UIElement)
	TextInputUpdate	(Inherited from System.Windows.UIElement)
	Unloaded	(Inherited from System.Windows.FrameworkElement)

AutoSized Event

Occurs when the row header is auto sized.

Syntax

Visual Basic (Declaration)

```
Public Event AutoSized As System.EventHandler
```

C#

```
public event System.EventHandler AutoSized
```

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

IsMouseOverChanged Event

Event raised when the **IsMouseOver** property has changed.

Syntax

Visual Basic (Declaration)
`Public Event IsMouseOverChanged As System.EventHandler(Of PropertyChangedEventArgs(Of Boolean))`
C#
`public event System.EventHandler<PropertyChangedEventArgs<bool>> IsMouseOverChanged`

Event Data

The event handler receives an argument of type C1.Silverlight.PropertyChangedEventArgs<T> containing data related to this event. The following **PropertyChangedEventArgs<T>** properties provide information specific to this event.

Property	Description
NewValue	
OldValue	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

PropertyChanged Event

Occurs when a property value changes.

Syntax

Visual Basic (Declaration)	
`Public Event PropertyChanged As System.ComponentModel.PropertyChangedEventHandler`	
C#	
`public event System.ComponentModel.PropertyChangedEventHandler PropertyChanged`	

Event Data

The event handler receives an argument of type System.ComponentModel.PropertyChangedEventArgs containing data related to this event. The following **PropertyChangedEventArgs** properties provide information specific to this event.

Property	Description
PropertyName	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

See Also

Reference

Resized Event

Occurs when the row header is resized.

Syntax

Visual Basic (Declaration)	
`Public Event Resized As System.EventHandler(Of PropertyChangedEventArgs(Of Double))`	
C#	
`public event System.EventHandler<PropertyChangedEventArgs<double>> Resized`	

Event Data

The event handler receives an argument of type C1.Silverlight.PropertyChangedEventArgs<T> containing data related to this event. The following **PropertyChangedEventArgs<T>** properties provide information specific to this event.

Property	Description
NewValue	
OldValue	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Resizing Event
Occurs when the row header is resized.

Syntax

Visual Basic (Declaration)	
`Public Event Resizing As System.EventHandler(Of PropertyChangedEventArgs(Of Double))`	

C#

```
public event System.EventHandler<PropertyChangedEventArgs<double>> Resizing
```

Event Data

The event handler receives an argument of type C1.Silverlight.PropertyChangedEventArgs<T> containing data related to this event. The following **PropertyChangedEventArgs<T>** properties provide information specific to this event.

Property	Description
NewValue	
OldValue	

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

Members

Fields Properties Methods Events

The following tables list the members exposed by DataGridRowPresenter.

Public Constructors

	Name	Description
	DataGridRowPresenter Constructor	Initializes a new instance of a DataGridRowPresenter.

Top

Public Fields

	Name	Description
S	BackgroundBrushProperty	Identifies the BackgroundBrush dependency property.
S	CellsAreaMarginProperty	Identifies the CellsAreaMargin dependency property.

S	HorizontalGridLineBrushProperty	Identifies the HorizontalGridLineBrush dependency property.
S	HorizontalGridLineOpacityProperty	Identifies the HorizontalGridLineOpacity dependency property.
S	HorizontalGridLineVisibilityProperty	Identifies the HorizontalGridLineVisibility dependency property.
S	RowAreaMarginProperty	Identifies the RowAreaMargin dependency property.
S	ValidationBackgroundProperty	Identifies the ValidationBackground dependency property.
S	ValidationResultsProperty	Identifies the ValidationResults dependency property.
S	ValidationStateProperty	Identifies the ValidationState dependency property.
S	VerticalGridLineBrushProperty	Identifies the VerticalGridLineBrush dependency property.
S	VerticalGridLineVisibilityProperty	Identifies the VerticalGridLineVisibility dependency property.

Top

Public Properties

	Name	Description
	ActualHeight	(Inherited from System.Windows.FrameworkElement)
	ActualWidth	(Inherited from System.Windows.FrameworkElement)
	AllowDrop	(Inherited from System.Windows.UIElement)

	Background	(Inherited from System.Windows.Controls.Control)
	BackgroundBrush	Gets or sets the **System.Windows.Media.Brush** used in the background of the row.
	BorderBrush	(Inherited from System.Windows.Controls.Control)
	BorderThickness	(Inherited from System.Windows.Controls.Control)
	CacheMode	(Inherited from System.Windows.UIElement)
	CellsAreaMargin	Gets or sets a **Margin** that can be applied to a **System.Windows.UIElement** locating the element in the area where the cells are shown, typically this margin is applied to the cells panel.
	CellsPanel	Gets the cells panel inside this row presenter.
	CharacterSpacing	(Inherited from System.Windows.Controls.Control)
	Clip	(Inherited from System.Windows.UIElement)
	Cursor	(Inherited from System.Windows.FrameworkElement)
	DataContext	(Inherited from System.Windows.FrameworkElement)
	DataGrid	Gets the data grid associated with this presenter.
	DesiredSize	(Inherited from System.Windows.UIElement)
	Dispatcher	(Inherited from System.Windows.DependencyObject)
	Effect	(Inherited from System.Windows.UIElement)
	FlowDirection	(Inherited from System.Windows.FrameworkElement)
	FontFamily	(Inherited from System.Windows.Controls.Control)

	FontSize	(Inherited from System.Windows.Controls.Control)
	FontStretch	(Inherited from System.Windows.Controls.Control)
	FontStyle	(Inherited from System.Windows.Controls.Control)
	FontWeight	(Inherited from System.Windows.Controls.Control)
	Foreground	(Inherited from System.Windows.Controls.Control)
	Height	(Inherited from System.Windows.FrameworkElement)
	HorizontalAlignment	(Inherited from System.Windows.FrameworkElement)
	HorizontalContentAlignment	(Inherited from System.Windows.Controls.Control)
	HorizontalGridLineBrush	Gets or sets the **System.Windows.Media.Brush** used to highlight the horizontal grid lines.
	HorizontalGridLineOpacity	Gets or sets the opacity of the horizontal grid line.
	HorizontalGridLineVisibility	Gets or sets the visibility of the horizontal grid lines of this row, If true, the horizontal grid lines are shown.
	IsEnabled	(Inherited from System.Windows.Controls.Control)
	IsHitTestVisible	(Inherited from System.Windows.UIElement)
	IsTabStop	(Inherited from System.Windows.Controls.Control)
	Item	Gets the DataGridCellPresenter with the specified column.
	Language	(Inherited from System.Windows.FrameworkElement)
	Margin	(Inherited from System.Windows.FrameworkElement)
	MaxHeight	(Inherited from System.Windows.FrameworkElement)

	MaxWidth	(Inherited from System.Windows.FrameworkElement)
	MinHeight	(Inherited from System.Windows.FrameworkElement)
	MinWidth	(Inherited from System.Windows.FrameworkElement)
	Name	(Inherited from System.Windows.FrameworkElement)
	Opacity	(Inherited from System.Windows.UIElement)
	OpacityMask	(Inherited from System.Windows.UIElement)
	Padding	(Inherited from System.Windows.Controls.Control)
	Parent	(Inherited from System.Windows.FrameworkElement)
	Projection	(Inherited from System.Windows.UIElement)
	RenderSize	(Inherited from System.Windows.UIElement)
	RenderTransform	(Inherited from System.Windows.UIElement)
	RenderTransformOrigin	(Inherited from System.Windows.UIElement)
	Resources	(Inherited from System.Windows.FrameworkElement)
	Row	Gets the row associated with this presenter.
	RowAreaMargin	Gets or sets a **Margin** that can be applied to a **System.Windows.UIElement** inside a row presenter ensuring the element won't be scrolled even whether the row is scrollable.
	Style	(Inherited from System.Windows.FrameworkElement)
	TabIndex	(Inherited from System.Windows.Controls.Control)
	TabNavigation	(Inherited from System.Windows.Controls.Control)

	Tag	(Inherited from System.Windows.FrameworkElement)
	Template	(Inherited from System.Windows.Controls.Control)
	Triggers	(Inherited from System.Windows.FrameworkElement)
	UseLayoutRounding	(Inherited from System.Windows.UIElement)
	ValidationBackground	Gets or sets the brush used to paint the background of the validation elements.
	ValidationResults	Gets or sets a collection of ValidationResult related to the corresponding row. When the number of errors is greater than 0 the background of the row will became red.
	ValidationState	Gets or sets the ValidationState.
	VerticalAlignment	(Inherited from System.Windows.FrameworkElement)
	VerticalContentAlignment	(Inherited from System.Windows.Controls.Control)
	VerticalGridLineBrush	Gets or sets the **System.Windows.Media.Brush** used to highlight the vertical grid lines.
	VerticalGridLineVisibility	Gets or sets the visibility of the vertical grid lines of this row, If true, the vertical grid lines are shown.
	Visibility	(Inherited from System.Windows.UIElement)
	Width	(Inherited from System.Windows.FrameworkElement)

Public Methods

	Name	Description
	AddHandler	(Inherited from System.Windows.UIElement)

	ApplyTemplate	(Inherited from System.Windows.Controls.Control)
	Arrange	(Inherited from System.Windows.UIElement)
	CaptureMouse	(Inherited from System.Windows.UIElement)
	ClearValue	(Inherited from System.Windows.DependencyObject)
	FindName	(Inherited from System.Windows.FrameworkElement)
	Focus	(Inherited from System.Windows.Controls.Control)
	GetAnimationBaseValue	(Inherited from System.Windows.DependencyObject)
	GetBindingExpression	(Inherited from System.Windows.FrameworkElement)
	GetValue	(Inherited from System.Windows.DependencyObject)
	InvalidateArrange	(Inherited from System.Windows.UIElement)
	InvalidateMeasure	(Inherited from System.Windows.UIElement)
	Measure	(Inherited from System.Windows.UIElement)
	OnApplyTemplate	Overridden. Builds the visual tree for the DataGridRowPresenter control when a new template is applied.
	ReadLocalValue	(Inherited from System.Windows.DependencyObject)
	ReleaseMouseCapture	(Inherited from System.Windows.UIElement)
	RemoveHandler	(Inherited from System.Windows.UIElement)
	SetBinding	(Inherited from System.Windows.FrameworkElement)
	SetValue	(Inherited from System.Windows.DependencyObject)
	TransformToVisual	(Inherited from System.Windows.UIElement)

	UpdateCurrentCell	Updates the current cell.
	UpdateEditingRow	Updates the editing state.
	UpdateLayout	(Inherited from System.Windows.UIElement)
	UpdateLines	Updates the border lines of the cells.
	UpdateMouseOver	Updates the mouse over state.
	UpdateSelection	Updates the selection state.
	UpdateValidationState	Updates the validation state.

Public Methods

	Name	Description
	AddHandler	(Inherited from System.Windows.UIElement)

	ApplyTemplate	(Inherited from System.Windows.Controls.Control)
	Arrange	(Inherited from System.Windows.UIElement)
	CaptureMouse	(Inherited from System.Windows.UIElement)
	ClearValue	(Inherited from System.Windows.DependencyObject)
	FindName	(Inherited from System.Windows.FrameworkElement)
	Focus	(Inherited from System.Windows.Controls.Control)
	GetAnimationBaseValue	(Inherited from System.Windows.DependencyObject)
	GetBindingExpression	(Inherited from System.Windows.FrameworkElement)
	GetValue	(Inherited from System.Windows.DependencyObject)
	InvalidateArrange	(Inherited from System.Windows.UIElement)
	InvalidateMeasure	(Inherited from System.Windows.UIElement)
	Measure	(Inherited from System.Windows.UIElement)
	OnApplyTemplate	Overridden. Builds the visual tree for the DataGridRowPresenter control when a new template is applied.
	ReadLocalValue	(Inherited from System.Windows.DependencyObject)
	ReleaseMouseCapture	(Inherited from System.Windows.UIElement)
	RemoveHandler	(Inherited from System.Windows.UIElement)
	SetBinding	(Inherited from System.Windows.FrameworkElement)
	SetValue	(Inherited from System.Windows.DependencyObject)
	TransformToVisual	(Inherited from System.Windows.UIElement)

	UpdateCurrentCell	Updates the current cell.
	UpdateEditingRow	Updates the editing state.
	UpdateLayout	(Inherited from System.Windows.UIElement)
	UpdateLines	Updates the border lines of the cells.
	UpdateMouseOver	Updates the mouse over state.
	UpdateSelection	Updates the selection state.
	UpdateValidationState	Updates the validation state.

OnApplyTemplate Method

Builds the visual tree for the DataGridRowPresenter control when a new template is applied.

Syntax

Visual Basic (Declaration)

```
Public Overrides Sub OnApplyTemplate()
```

C#

```
public override void OnApplyTemplate()
```

Remarks

This method is invoked whenever application code or an internal process, such as a rebuilding layout pass, calls the **ApplyTemplate** method.

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

UpdateCurrentCell Method

Updates the current cell.

Syntax

Visual Basic (Declaration)
`Public Overridable Sub UpdateCurrentCell()`
C#
`public virtual void UpdateCurrentCell()`

Requirements

Target Platforms: Windows 7, Windows Vista SP1 or later, Windows XP SP3, Windows Server 2008 (Server Core not supported), Windows Server 2008 R2 (Server Core supported with SP1 or later), Windows Server 2003 SP2

UpdateEditingRow Method

Updates the editing state.

Syntax

Visual Basic (Declaration)
`Public Overridable Sub UpdateEditingRow()`

C#

```
public virtual void UpdateEditingRow()
```

Requirements
